

SSC Summary Report – March 2019 Meeting

Review of Generic ACL Carryover Amendment

Gulf of Mexico Fishery Management Council

April 1-4, 2019 Meeting

Biloxi, MS

Summary SSC Comments

- Simulations previously conducted by the SEFSC showed no adverse effects from carryover of left-over yield (ACL).
 - Production (G & R) from previous year not part of current carryover
 - However, simulations did not take overages into account
- SSC had questions about potential impact of overages and current 1:1 payback on sustainability of carryover provision:
 - Current simulation results do not address future foregone recruitment by the fish removed through excessive harvest

Motion: The SSC moves that the Council request that the SEFSC include periodic underages and overages of the ACL in the simulations for carryover
