## Questions regarding projection settings

1. $40 \%$ SPR proxy for calculating benchmarks

## Projection settings

| Parameter | Value | Comment |
| :---: | :---: | :---: |
| Relative F | Average from 2019-2021 | Average relative fishing mortality (apical F) over terminal three years |
| Selectivity | Average from 2019-2021 | Fleet specific selectivity estimated over terminal three years |
| Recruitment (Benchmarks) | Beverton-Holt stock-recruitment relationship | Derived from the model estimated Beverton-Holt stock-recruitment relationship |
| Interim Landings (2022-2024) | 9.04/6.85 metric tons (Commercial Vertical Line - East) 12.53/11.01 metric tons (Commercial Vertical Line - West) 161.73/202.74 metric tons (Commercial Longline - East) 34.38/47.48 metric tons (Commercial Longline - West) | Landings provided for 2022 For 2023 and 2024, used 2-year average (2021-2022) |
| Allocation Ratio | None |  |

## Stock Status: 40\%SPR

- Gulf of Mexico Yellowedge Grouper is not overfished but is undergoing overfishing at 40\% SPR

## Thank you for your attention! Questions?

The SEDAR 85 Operational Assessment for Gulf of Mexico Yellowedge Grouper would not have been possible without the efforts of the numerous SEFSC, SERO, and GMFMC staff along with the many state, academic, and research partners involved throughout the Gulf of Mexico. The following agencies contributed to the assessment and deserve notable attention and thanks for efforts extended to developing data inputs: NOAA SEFSC Fisheries Statistics Division (FSD), NOAA SEFSC Panama City Laboratory, NOAA SEFSC Mississippi Laboratories, NOAA Southeast Regional Office (SERO), Florida Fish and Wildlife Conservation Commission, Fish and Wildlife Research Institute, NOAA SEFSC Beaufort Laboratory, and the Gulf States Marine Fisheries Commission. Special thanks are also extended to the Data Updates Topical Working Group members for their rapid and helpful guidance with model development.
