The Reef Fish Management Committee of the Gulf of Mexico Fishery Management Council convened via webinar on Monday afternoon, October 26, 2020, and was called to order by Chairman Martha Guyas.

# ADOPTION OF AGENDA APPROVAL OF MINUTES ACTION GUIDE AND NEXT STEPS

CHAIRMAN MARTHA GUYAS: We will call the Reef Fish Committee to order. This is a committee of everyone, and so, in case you were wondering if you are on this committee, yes, you are. The first thing on our agenda is Adoption of the Agenda. Are there any additions or modifications to the agenda, other than what Dr. Frazer just described? Kevin.

MR. KEVIN ANSON: Thank you. I raised my hand digitally a minute ago, but I didn't see my name being typed, and so I would like to add, under Other Business, a discussion about how dead discards are treated in the red snapper assessment in both the recreational and commercial sectors, just probably with Dr. Porch, and, depending upon that discussion goes, maybe develop a motion for further review by the SSC. Thank you.

 CHAIRMAN GUYAS: All right. Thanks, Kevin. Anyone else? I am not seeing any other hands, and so are there any objections to adopting the agenda as modified? Next, we have the minutes, and I believe those went out as an email yesterday, or early today, and are there any changes to the minutes? Any opposition to approving the minutes as written? Seeing none -- I think there was no objection there, and so, seeing none, the minutes are approved.

If we could, we can just go through our action guide item-byitem when we get to that item, and I think that might be
helpful, especially if we're going to have this committee over
two days, and so I guess, with that, I think our next item would
be review of the reef fish landings. Peter, are you going to
take us through those?

### REVIEW OF REEF FISH LANDINGS

 MR. PETER HOOD: Yes, I am. If that could be brought up, that would be great, and I think, in the interest of time, what I'm going to do is just focus on commercial landings, and Dr. Cody is going to be talking a little bit about where we are with recreational landings. If you're curious about what's been reported to date, and by whom, our rec data, we have MRIP for

January 1 through the end of February, and so Wave 1, and we 2 have the Headboat Survey through June 30, and LA Creel through 3 September 13.

4 5

6

7

1

That information is there, but, again, it's not the picture, and so I don't know if it's really worth going over in too much detail, and so here is commercial data for gray triggerfish and greater amberjack.

8 9 10

11

12

13

You can see we're under the ACL this year. For 2020, we have caught about 41,000 pounds for gray triggerfish, compared to 62,000 pounds in 2019, and, for greater amberjack, it's about 265,000 for this year, compared to -- Sorry. It's hard to read on my screen. It's a little over 356,000 pounds in 2019.

14 15 16

17

18

19

20

21 22

23

24 25 In the tables below that, we have gag, red grouper, and red snapper, and current landings for gag are about 400,000 pounds, and that's about 43 percent of the quota. For red grouper, it's, 1,703,000 pounds, which is about 56.8 percent of the quota, and then the red snapper is about -- Over five-million pounds have been landed, which is about 75 percent of that quota, and you can see we're sort of probably in landing this year what was landed last year, and maybe we're at little bit behind, and I know, at some point, you'll receive a presentation from Dr. Stephen, who will get into this in a little bit more detail, and so we can scroll down.

26 27 28

29 30

31

32

The next page is recreational landings, and, again, I said I wasn't going to get into those too much, and this is for greater On this page, we have gag, gray triggerfish, red amberjack. grouper, and red snapper for-hire. Again, we don't have complete landings, and so we really can't -- It's hard to really talk about any kind of trends here.

33 34 35

36

37

38

39

40

41

42

The next page is going to be where we have stock ACLs, and we have it divided out between commercial and recreational. should probably talk a little bit about some of the things that are going on on the commercial side. For gray snapper and vermilion snapper, so far this year, we have caught a little over half of what was caught during the previous year. snapper, we've caught, this year, about two-thirds of what was caught in 2019, and then, for hogfish and mutton snapper, what's been caught so far in 2020 is comparable to 2019.

43 44 45

46

47

48

What will be coming up is some figures, and, basically, it's showing what was caught for greater amberjack triggerfish in previous years, and that was presented at the October council meeting. In one more page, you will see some

bar graphs, but, basically, similar to what I presented in September, the landings in 2020 are a little bit off for these two species compared to 2017 through 2019, but we're still kind of in the ballpark there.

 Everything else basically is either stock or recreational landings, and the stock landings are basically recreational and commercial landings combined, and, again, I don't know how much information is really there for you, and I think I've hit the high points, in terms of commercial landings, and I will leave it there, and I'm looking forward to hearing Dr. Cody talk a little bit about what's going to happen with recreational landings, and so thank you.

CHAIRMAN GUYAS: Thanks, Peter. I see a couple of hands going up with questions. Susan.

MS. SUSAN BOGGS: Maybe I misunderstood, because we're going fairly quickly, but, on the stock complexes, Peter, I understood you to say that gray snapper and lane snapper were in line with 2019, but that math does not compute with me, and am I missing something?

MR. HOOD: I'm sorry, and maybe I didn't explain it quite right. For -- Let's see. You said gray snapper and lane snapper?

MS. BOGGS: I mean, that's what I understood you to say. Yes, sir.

MR. HOOD: So where we are right now with gray snapper, what was caught in this year, 2020, is a little bit more than half of what was caught in 2019, and so, for the commercial fishery, we're -- I don't know if we'll catch the numbers that were caught in 2019, the poundage, rather. For lane snapper, basically, about 16,000 pounds has been caught so far this year, and, in 2019, almost 24,000 pounds was landed, and so it's about two-thirds of -- We're at about two-thirds of what was caught in 2019.

40 MS. BOGGS: What you're saying now makes sense, and what you said in the presentation just threw me off. Thank you.

43 MR. HOOD: Sorry. I was trying to quickly, because I know there's a lot of things that you really want to get it, and I'm just trying to move things along.

CHAIRMAN GUYAS: I think I see Ms. Bosarge's hand.

MS. LEANN BOSARGE: I think he just explained what I needed, and I was trying to follow him too, and don't ever try and rush through this. This is important stuff, and it kind of is the basis for a lot of our other decisions. We'll give you what you need in time. The floor is yours.

CHAIRMAN GUYAS: Thanks, Leann. Any other hands with questions for Peter? If not, I believe Dr. Cody is on deck to give us our next presentation about how they're approaching recreational landings in 2020. I don't know if staff wants to provide an introduction to that from the action guide.

#### APPROACHES FOR ESTIMATING RECREATIONAL LANDINGS IN 2020

MR. RYAN RINDONE: I can if you would like.

CHAIRMAN GUYAS: Sure.

MR. RINDONE: This is actually something that we had added in between the iterations of things getting posted, but, essentially, what Dr. Cody is going to be doing for you guys is talking about the NOAA Office of Science and Technology's proposed approach for dealing with the estimates of recreational catch and effort for 2020 for data from Wave 2 moving forward due to COVID-19.

 You guys might remember Dr. Cody's talks in the past about how the effort side of things for the Fishing Effort Survey had continued largely uninterrupted. However, the dockside sampling that's conducted through the Access Point Angler Intercept Survey was interrupted, and it varied state-by-state, based on local restrictions as it related to social distancing and being precautious about COVID, and so Dr. Cody will be going into more detail here about the NOAA Office of Science and Technology's approach for moving forward with producing estimates for 2020.

DR. RICHARD CODY: Like Peter said, there have been significant effects on the recreational data, and what I'm going to present today, as Ryan described, is really just what we've been doing to-date and to give you a status update of where things are, in terms of coming up with 2020 estimates of recreational catch.

You have seen this slide over and over, and we present it every time we give a presentation on our data, but, basically, what it shows you is that we have a mix of different surveys to cover the nation, in terms of recreational data collection, and, depending on how these surveys are conducted, the pandemic has had differential effects, and so, for instance, we have some

surveys that are conducted in association with logbook reporting systems, and so logbooks have continued, and we've been able to get data from those, but the dockside part, or the in-person surveys associated with it, have been impacted by social distancing and safety measures.

For the survey approaches that are used, as I said, we have inperson, but we also have remote, or self-administered, surveys as well, and the remote, or self-administered surveys, have been basically continuing, largely unimpacted, and these are the surveys such as telephone surveys and mail surveys, that there is no need for one-to-one in-person interaction to occur.

I borrowed these slides, by the way, from the CCC, the council CCC meeting, recently that Cisco Werner presented, and he started off by just setting the stage, and, basically, what it says is that, to our mail and telephone surveys used to estimate effort, we've had minimal impacts to those surveys, and we've been able to continue largely uninterrupted, but, with the shoreside surveys in particular, we've had significant impacts to our ability to collect data. Even with state-developed sampler protocols, safety protocols, and the resumption of sampling, it has continued to be impacted by the conditions in the field.

 This is really just to illustrate the fact that in-person interviews require you getting close to an angler, so you can get information from them on their trip, but also on their catch, and so getting close enough to be able to measure and weigh catch can be problematic.

The Access Point Angler Intercept Survey, or our dockside survey, is conducted along the Atlantic coast, from Maine to Mississippi in the Gulf, and decisions basically to suspend the -- At the state level, we were kept informed in the process, and the states were very accommodating in letting us know their plans for suspending and then resuming sampler activity.

Between March and August, seventeen of the states had suspended or reduced or modified their conduct of the APAIS survey, and so what this means is that sampling guidelines had to be adapted to continue sampling, and this impacted the sampler productivity, in terms of the numbers of interviews, the numbers of weights and lengths, and completed interviews that they were able to accomplish, but, as of about August 1, all of the state partners have resumed shoreside sampling. At-sea headboat, and then also our regular headboat, the Southeast Regional Headboat Survey, that has not resumed its field activity, but, again, the logbook

has continued throughout.

The conduct of the APAIS continues to be impacted, even now, and that's largely because of social distancing guidelines and sampler safety protocols, and we were involved with discussions with the states, many of the states, on the development of sampler protocols, and we're very encouraged by the amount of cooperation between the states and coming up with consistent sampler guidelines that I think helped the survey resume at, least if not unimpacted, but at a consistent level of safety protocols.

We can skip through this, and there's only two things that I want to point out in this slide, and that is, as I mentioned, we have a number of different surveys that have been impacted in different ways, and the Southeast Regional Headboat Survey, as I mentioned, the sampling activities, the dockside sampling, has been suspended, but the logbook reporting still continues, and we have heard from some of the states, especially in the Gulf, that they have made modifications to their sampling protocols.

 The Fishing Effort Survey, as I mentioned, is our main vehicle for collecting information on recreational fishing effort, or numbers of trips, and this is conducted largely Maine through Mississippi, following the distribution of the APAIS survey, and also in Hawaii, and, as I said, the offsite portion of the data collection continued largely uninterrupted. However -- And we do continue to publish the wave-level fishing effort fishing estimates, but there have been some impacts to off-frame adjustments that we get from the dockside survey.

 For instance, the dockside survey is used to account for out-of-state fishing effort, and the Fishing Effort Survey really is done with resident anglers, and is able to account for resident angler effort, but there is some out-of-state effort as well, and we think that this impact, by not being able to get the adjustments from the APAIS, will be fairly -- It shouldn't be a huge factor, because of the travel restrictions and reduced tourism, basically, early on in the survey, and we're not so sure, later on, if that ticked up or if the out-of-state effort may have changed, but we think, early on at least, it would have had a minimal effect on the overall effort estimates.

Just to give you a status update of where we are, or what you can find on our website, we have published preliminary shore, private boat, and for-estimates for Waves 2 and 3, and, actually, 4 as well that were impacted by the survey, and so, for the entire year, basically, up until Wave 4, which would

have been July and August, and those estimates are available on our website.

These are produced using our standard methodology, but, as I mentioned, it's lacking some of the components that we normally would have picked up from the Access Point Angler Intercept Survey to make adjustments for off-frame fishing effort. The estimates are not available through the query tool, and they are expected to change before they are published as final at this point, but they are available as a downloadable spreadsheet on the website.

The catch estimates, that's a different story entirely, and, due to the significant data gaps that we've seen, we decided not to publish anything from Waves 2 through 6, because it wouldn't result in an annual estimate, and we would be missing at least Wave 2, in particular, and we've been missing practically every bit of intercept information that we would normally have expected.

We are working with the Regional Offices and the Science Centers to assess the impacts of this decision, knowing that the councils and other regional Science Centers and offices did use the wave-level estimates to get an idea of the status of catch throughout the year, and one thing I will add is that it's really very difficult, at this point, to get a full appreciation of the data gaps that are in the data that will allow us to produce reliable estimates, and that's really the basis for our decision not to publish, at this point, wave-level estimates.

Just to give you an idea of the extent of the gaps, these are a couple of different diagrams that we have here. Basically, what's presented here is a ratio of the 2020 data through an average of the last three years, and so 2017 through 2019, and what you're looking at here is the proportion of 2020 intercepts, based on the average for the previous three years, and, as you can see, the gray color points to the zero overlap there, and there is basically no data collected, and those colors change until you get to greater than 75 percent, and so that's close to being what it was back for the average for the three years.

You will see, on the horizontal access, that you have the months denoted as numbers, and you will see, for April, there is a black line delineating April, and there is practically no intercept data available, and we saw, about mid-March, where states began to ramp down their efforts to collect data, based on guidance at the state level and local levels to commit to

social distancing measures.

You will see that, in the month of May also, there were significant data gaps, and I will point out that Alabama, Florida, and Mississippi are on the right here, the far-right right of the graph, and so that's the Gulf surveys, and you will see that there's been a little bit of resumption of activities past June, and that has continued into August.

I mentioned that one of the things that we noticed is that the social distancing guidelines, and the pandemic in general, have resulted in decreased accessibility of the catch, and so it's very difficult, exercising social distancing guidelines, to get adequate length and weight data, and this is basically a similar kind of graph that I just showed you, and the last one was for angler intercepts, and this is really based on the number of length measurements that we get, and, again, you will see similar holes in the data for April, and continuing through May, but you will see that there are significant gaps that have continued since then, with the social distancing guidelines. Things haven't quite gotten got back to normal.

Then the last slide is really just the weight measurements here, showing you a similar picture to what you saw for the length data, and so that gives you an impression, at least, of the data gaps that we are trying to deal with right now at this point.

What are our catch estimation options? Obviously, we have significant gaps throughout 2020, and we are looking at different techniques right now, and we're in consultation with Westat statisticians, Jean Opsomer and Mike Brick, and what we've been pursuing are different techniques, a different imputation method, that uses a variety of large domain versus small area estimation approaches.

In large domain estimation, really, you're just aggregating, but sticking within the survey design constraints. They try not to violate any survey design elements that you have in place, but you're aggregating data to get to a point where you can produce a viable estimate. That's not ideal, because you may have to go to levels that are above the state, in some cases, to get an estimate. Small area estimation is something that we already use, in terms of length and weight data imputation, and we use that technique regularly to fill in data gaps for length and weight information.

The take-home here is that any estimates that we get will likely need to be revisited once we have had a chance to produce them,

and we expect revisions going forward, because the imputation methods basically are better informed with the more data that you have, and so we would expect that, once we have a shoulder year of 2019 and a shoulder year of 2021, that we would go back and revisit the 2020 estimates relative to those two years, to see if we can improve the estimates for 2020.

Ongoing work, I mentioned a little bit about the work that we're doing with Westat consultants, but, as part of that, what we've been doing, instead of just waiting for all of the 2020 data to get here, is we've been looking at the 2020 data, the gaps that are in there, and using that to use 2019 data to model what we would expect to see for 2020, and, also, this gives us an opportunity to test the programs that we're using to incorporate data and to produce the estimates.

Those are ongoing right now, and they're, I think, proceeding pretty well, in terms of their ability to handle data, and so the next steps really are to evaluate our options for imputation, and so that means really just where are we going to get the proxy data, or the data that we use, to fill in the data gaps and how many -- What kinds of assumptions are we making in terms of taking data that wasn't collected and using that as a proxy?

Hopefully, by the time we're finished testing with the 2019 data, we'll be ready to apply this to the 2020 data, and the documentation for that will be made available, so that people can see how the process worked. I think that was my last slide, and so, if anybody has any questions, I would be happy to try and entertain them, and I know I left out a lot of the details of how this imputation methodology would work, but I would be happy to provide some of that information in writing, as far as documentation is concerned.

 CHAIRMAN GUYAS: All right. Thanks, Richard. I will give folks a minute to get their hands up. In the meantime, I've got a couple of questions for you. One is about your impact slide, and you mentioned that you were working with the Regional Offices and the Science Centers to understand the impacts of holding back the catch estimates, for I guess everything Wave 2 and on, and are also talking to some of the states about this, since those data are used to monitor state-managed and inshore species?

DR. CODY: We're in regular contact with the states, as far as the conduct of the survey is concerned, and I won't say that we've had detailed discussions with them at this point, because

we had to wait for our leadership to approve our plan to not publish wave-level estimates at this point.

I think the states have been made aware that we're not doing that, and there has been a roll-out time, each wave, for all of the estimates that we have produced, and that has delayed things slightly, but I think that, overall, NOAA communications has done a pretty good job with that, but I think that, going forward, the states would be part of the discussion.

**CHAIRMAN GUYAS:** My other question is are you all looking at exploring each of the supplemental surveys that we have in the Gulf of Mexico to help fill some of the gaps that MRIP is experiencing?

DR. CODY: As I mentioned, those surveys have also experienced some of the same issues that we have with the large federal survey, but, at this point, we're willing to look at whatever data we can get our hands on to try and inform the estimates. We did try, at one point, to try and get an additional survey, an emergency approval, through the White House Office of Management and Budget, but they balked at that, and so, at this point, we are looking at all of our options for informing the estimates, and so we would expect to at least look at if that can be done with the state-level surveys, at least for some species.

CHAIRMAN GUYAS: All right. Thanks, Richard. I see Leann's hand is up.

MS. BOSARGE: Thank you, Madam Chair. I think Richard just kind of touched on, and so did Martha, my thought process in this, is how much communication is going on with the states, and it doesn't -- It sounds like it's been somewhat limited thus far, and I just hate that we're operating in this mini bubbles, right, and everybody seems to be going to recreate their own wheel.

The states have their own data collection programs, and they had gaps too, and I'm sure they're trying to figure out how to fill in the gaps that they had, and so, you know, it would be nice if everybody could collaborate on this, in our kumbaya world that I want to believe we have, but I don't see that happening, and so, in that effort, and in an effort to look at some of that state data as an asset to help fill in the gaps for Dr. Cody, I would love to see a presentation from each of the states on how they are dealing with the holes that COVID created in their data system and what assumptions they're making and what information

they're using to inform those gaps.

 Not to mention that FES only covers three of the Gulf states, and so I think it's vital that we also hear from LA Creel and from Texas, for their data gaps, and how are they going about filling that in, because we have to put all this stuff together to come up with recreational landings, and so I don't know if the states could do that by the next meeting, because I realize that's a quick turnaround, but I would like to hear some feedback from states on that kind of presentation.

DR. CODY: Could I just make a comment on that?

CHAIRMAN GUYAS: Sure. Go ahead.

DR. CODY: Part of the reason there's been limited contact at this point, other than just trying to get a handle on where the states have felt like they've had difficulties ramping up survey activity, is because we haven't had the methods outlined to a point where we could present them to the states, or elsewhere, and I think, as the -- Most states came back online August 1, and there was sort of a wait-and-see, to see how well they were able to respond, or how well they're able to deal with the restrictions that they have.

I think, from my perspective, I think we've been pleasantly surprised by how much they have been able to collect, and that has helped, in the last few weeks, to flesh out the methods that we're looking at, and so I think that there is promise, at this point, that we will have something, if it's not tested, at least available close to the end of the year, but I think that we would be -- You make a very good point that there needs to be some communication on what forms of data are available, so that maybe both state and the federal estimates can be better informed.

MS. BOSARGE: Can I follow-up, Martha?

CHAIRMAN GUYAS: Sure. Go ahead.

 MS. BOSARGE: You said the methods hadn't been developed yet, and that's why there's been some limited communication, but I guess that's what I'm trying to drive home here, is that I would venture to guess that GRFS has some holes in their data too, and they're coming up with methods on how to fill that methodology and how they're going to deal with that.

FES is coming up, or the federal system, whatever you want to

call it, is coming up with their methodology, and LA Creel is probably coming up with methods for how -- We all need to -- We can't keep operating in our own little bubbles and not communicating until everybody has come up with their methods, and then you have these huge differences.

I think this is a great time to start collaborating more, and I think the best way to go about that is to have a presentation at the council, and we can listen to all these different methods that each state or FES is using, how they're thinking about this, and we can all learn from each other, and that's what I'm hoping for.

CHAIRMAN GUYAS: All right. Thanks, Leann. Are there other thoughts on this topic? Are there any other questions for Richard? Okay. I guess, to Leann's question about future presentations by the states, for the past few meetings, I think each state has kind of run down the status of their data collection, in general, and I don't know how much wiggle room we have in the agenda for November/December, and I'm guessing it's pretty limited, but maybe Dr. Simmons, or Dr. Frazer, and I don't know if you want to weigh-in on that, on another series of presentations from states.

EXECUTIVE DIRECTOR CARRIE SIMMONS: Thank you, Madam Chair. I would say, right now, we have pretty much finalized the November/December agenda, but, with this hurricane, I'm not sure what's going to happen, and it's all up in the air, and I don't know. Is it three strikes and you're out? I'm not sure.

CHAIRMAN GUYAS: Yes. It wouldn't be a council meeting week if there wasn't a hurricane then. It seems, if there's no meeting, there's no hurricane. Ιf there's a meeting, there's a Well, I guess that idea is out there, Okay. potentially, for a future meeting, if we have -- If we find ourselves with some space on the agenda. All right. I am not seeing any more hands on this topic. It's 4:21, and, Dr. Frazer, I'm assuming you want to call it a day at this point.

 DR. TOM FRAZER: I think, again -- I mean, we're in a tough spot, and so this is I think how we'll proceed. I mean, we do -- I did call for a hard stop at 4:30, and we've had a couple of folks that have had to drop off already because of a prior commitment, and so I want to be mindful of those schedules, but realize that we do have some business to take care of, and I would like to push through Reef Fish tomorrow.

We will watch the forecast tonight and get a good idea of what's

going on, but I think everybody should be prepared to join promptly tomorrow, in the morning, and then we'll provide an update, right before you get started, about how we're going to proceed, and so I appreciate everybody's effort to try to move some things along today.

Again, I will -- Up on the screen, there is an opportunity to participate in some of the visioning components of this greater amberjack research program, which is analogous, in many ways, to the Great Red Snapper Count, and so, if you have an opportunity to pop on there, you might find that very interesting. We will go ahead and adjourn the meeting for today, and we will see you all tomorrow morning at nine o'clock. Thank you.

(Whereupon, the meeting recessed on October 26, 2020.)

October 27, 2020

TUESDAY MORNING SESSION

- -

The Reef Fish Management Committee of the Gulf of Mexico Fishery Management Council reconvened via webinar on Tuesday morning, October 27, 2020, and was called to order by Chairman Martha Guyas.

CHAIRMAN GUYAS: I think we are now on the Review of IFQ Program Landings and Fishing Industry Impacts Due to COVID-19. I think Dr. Stephen is going to present that. When you're ready, Dr. Stephen.

### REVIEW OF IFQ PROGRAM LANDINGS AND FISHING INDUSTRY IMPACTS DUE TO COVID-19 PANDEMIC

DR. JESSICA STEPHEN: This is the same type of presentation that we saw before, and we've just updated the data through September and then added some additional data through the point that we could in October.

As a quick reminder, we're looking at six different species to represent the six different share categories, with red snapper, gag, red grouper, yellowedge grouper, scamp, and golden tilefish. I will show you graphs of the landings as well as the allocation, and then we'll finish up with some carryover considerations, moving onward.

This is a similar graph that we've seen before with the red snapper landings, and, again, I just want to point out that the same structure will be for all of them, and we have the trip count, which is a proxy using our landings confirmations, in the upper-left, and then the upper-right are the pounds landed, and then the bottom-left is total ex-vessel value, and the bottom-right is weekly ex-vessel price per pound.

The things that I want to point out on the red snapper is that we're seeing a very similar pattern to what I just showed you in the last council meeting, where we see an increase showing there in the number of red snapper pounds landed, which is the light-blue-dotted line, the 2020 value, and the dotted-black line is 2019, and the gray is the average of 2017 to 2019.

In pounds landed, you see that 2020 value is approaching the average, and it is actually above that right now and approaching the 2019 value, and they're very similar to what we've seen of pounds landed before with red snapper. Number of trips, in general, is lower than we've seen before, and so it typically means that they might be landing more pounds per trip, in order to get the number of pounds similar to past values.

 When we're looking at the total ex-vessel value, we've seen that increase as well in 2020, that we're getting very similar to what the average was of 2017 to 2019, but we have not yet approached the 2019 value, in and of itself. One thing to take note of with the ex-vessel price per pound is that this does fluctuate week-to-week, which is dependent upon what dealers are landing and how many transactions they're putting through and how many pounds, and so those are a little bit more fluctuating, but we've seen that the 2020 value is fairly in line, again, with the average 2017 to 2019, but, overall, lower than we've seen in 2019.

It's the same four graphs, but looking at gag in this case. Again, it's similar patterns to what we've seen before. The ones I want to highlight here is that the pounds landed has approached the average value, 2017 to 2019, as has the total exvessel value, and it actually exceeded that there, but we're still below 2019. When we look at the ex-vessel price, we do see that 2020 is higher than the average, even though it's still below 2019, and so it's well within the range that we might expect at this point.

Red grouper is similar patterns to what we saw before, and I do want to remind everyone that the average 2017 to 2019 value, for

the pounds landed, is significantly higher, because the quota was higher, and so it's not really an apples-to-apples comparison, but, if we're looking at it compared to just the 2019 value, we are increasing the number of pounds landed compared to 2019, as well as the total ex-vessel value, and the ex-vessel price, which, again, fluctuates over time, is not quite approaching what we had in 2019, but we're within the ranges that we have typically seen for this species.

Yellowedge grouper, we're using this as a species to be a proxy for the deepwater grouper share category, and it is one of the primary species landed there, and it's a little bit more indicative of what drives the deepwater grouper share category as a whole, and, here we are seeing that be -- Number of trips, like the other species, is a little bit less than we've seen in previous years, and, in this case, that's also resulting in the number of pounds landed being less than we've seen in past years.

 Those two together combine to also make the total ex-vessel value less than we've seen in previous years. Looking a little bit more closely at what the ex-vessel price per pound is each week, again, we see a lot of fluctuation, and we are seeing an uptick at the very end, and we'll be monitoring that, to see if that's going to be a consistent pattern or just part of the fluctuation as a whole. The ex-vessel price per pound is more similar to what we've seen in past years, but a little bit less than what we saw in 2019.

In this slide, I have used scamp to be a proxy for the shallow-water groupers. Like yellowedge grouper, scamp is the primary species landed within this category, and it typically influences overall share category values moving forward.

Here, we see that the trip count is very similar to past years for scamp, and the pounds landed has actually been increasing over time, and it has increased compared to the 2019, although it's a little bit less than the average value. I want to remind folks that shallow-water grouper, as a category as a whole, fluctuates year to year fairly dramatically, and that's some of the reason that we see these differences.

When we look at the total ex-vessel value, that has actually increased past 2019, and, in some cases, depending on the week we're looking at, it was greater than what we've seen in the average years, and that can be seen in the weekly ex-vessel price. If you look at the blue line, we're actually exceeding some of the 2019 values during some weeks, in general.

I do want to point out that we had a kind of downtick in that last week for shallow-water grouper, but I would remind you that ex-vessel price is really dependent on who is turning in transactions within that week and, looking at the overall trends within it, it looks like we're probably going to be similar to what we've seen in past years for the year.

The last species that we're looking at for landings is golden tilefish, which is, again, the majority of our tilefish landed in general. In here, the number of trips has exceeded what we've seen in past years, even though the number of pounds is less than what we've seen in past years. We're also seeing the lower pounds resulting in a lower total ex-vessel value.

With golden tilefish, we typically see a lot of variation in the ex-vessel price, and it's been a little bit more apparent within 2020, where we're seeing much higher and lower bounds of that vessel price fluctuate between the different years. Again, this is a species that is one of the smallest portions of the fleet, and so we have a much smaller sample size when working with these.

Here, we're going to move on to the allocation, and allocation, again, is the transfer between the different participants. to orient you to the graph, this is only 2020 to 2019, and what we're looking at is the upper-left is the cumulative weekly allocation total value. In the upper-right, it's the weekly allocation pounds transferred, and so the total number of pounds transferred each week. Then the bottom-left is the number of transactions, and Ι will remind allocation you transaction can be anywhere from one pound to a thousand pounds, but not every transaction is equal to the pounds. Then we also took a look at what's going on with the weekly allocation and the price per pound for that.

 For red snapper, in general, what we're noticing is that the total value of allocation has remained consistent to past years, or maybe slightly increasing, currently, and, when we look at the weekly allocation pounds transferred, we do see that that is higher than 2019, but, again, I want to caution you that the reason that cumulative is higher probably occurred pre-COVID, when you see the shaded-blue area, where we increased the number of pounds overall early in the year.

When we look at how many transactions are occurring per week, we're pretty steady to what we've seen in the past, or maybe slightly less transactions, and that would be something that we

would expect if there isn't a lot of back-and-forth between the fishermen transferring allocation to people who might not have red snapper for a trip and then asking for it to be transferred back if they didn't land it.

Looking at the allocation price per pound, again, fluctuations occur within this, but, when you look at trends lines throughout this, these two values are not very different overall, and we do see that the 2020 allocation price is slightly lower, when we look at a trend line, than compared to 2019.

This is the same graph for gag. In gag, the total value for allocation is looking considerably different than 2019, but similar to what I've shown you in past meetings showing these different graphs, and, if we're looking at the allocation pounds transferred, we're definitely upticking in 2020 and getting a little bit closer to the cumulative amount that we would have seen in 2019. We're also seeing an increase in the number of transactions weekly in 2020.

It's a similar story in allocation price per pound, that we see a lot of fluctuation. In 2020, on average, it's probably going to come out slightly lower than what we saw in 2019.

Red grouper is very similar to what we saw in gag, in the patterns overall with the total value being significantly less than we've seen before, and the pounds being transferred also less, and this might have a little bit more also to do with the quota drops that we've seen in the last few years in red grouper and the market stabilizing from that.

 Similar, with the allocation price per pound, here, we're a little bit more similar than we've seen in the other species, and the trend lines are not very different at all, when looking at allocation price per pound throughout the year so far.

When looking at the other share categories, we have to look at the categories as a whole, because we don't have allocation prices per species, and so this is the deepwater allocation category, and I don't believe that we've shown these before, but what we're looking at here is that the total value for allocation for deepwater grouper is very similar to what we've seen in past years, although the amount of pounds being transferred is less.

Likewise, the number of transactions, we have kind of seen a decrease from Week 34 onward, that we're not having nearly as many transactions as we would have typically had in other years.

When we're looking at the allocation price per pound, we see that they're very similar to before, and you see some kind of peaks occur within both 2019 and 2020, but, in general, the differences are very slight, and we see 2020 probably averaging slightly lower than 2019.

Shallow-water grouper, as a category for allocation, it's similar to what we've seen in some of the other ones. There's a lower total value and lower number of pounds being transferred, and then, here, the weekly allocation price -- There is not as much fluctuation as we've seen in past years, and the overall kind of trend line for both of these is extremely similar.

The last allocation one is golden tilefish, and, again, it's similar trends to what we've seen before, with lower total value for allocation, in general, and lower amount of pounds being transferred, and this is also similar to what we saw before, and, in the last few weeks, we're also seeing a sort of decrease in the number of transactions that are occurring from Week 34 onward, and then the allocation price per pound fluctuates a little bit more here in 2020 that we've seen in some of the other species, but, when these are averaged out, again, it's very similar between the two.

This, again, is a comparison that we do on a monthly basis, and so this is all landings, up to September, for each of the years listed, and that's 2017 to 2020. I want to point out here that, when we look at red snapper, red grouper, and gag, we're seeing pretty much values or percentages of the quota landed that are on par with what we've seen in past years, and I want to caution you that red grouper, in 2017 and 2018, has significantly higher quota, and so I'm looking to compare red grouper solely to 2019.

When we look at the deepwater, shallow-water, and tilefish, we're seeing that they're a little bit lower than we've seen in past years, and shallow-water grouper, in general, fluctuates year to year, and so that isn't really an area of concern, looking at past behavioral patterns within the species, and we're going to be keeping an eye on what the deepwater grouper and tilefish do, since we're a little bit lower than what we would have anticipated, based on past years.

This is just looking at where we are in 2020, year to date, compared to where we end up at the end of the year for the other species. Again, red snapper, red grouper, and gag are looking like they're pretty much on par and that we'll be able to kind of come to similar percentages of quota landed by the end of the

year, and, again, you've seen a little bit of concern here in the deepwater, shallow-water, and tilefish, and so, when we looked at where we were, when we looked at the end of September, and we're about three weeks past that, and we've only increased a couple of percentage points for each one of those three categories at the end.

I am going to pause here, before I go back into the current IFQ system, and ask if there are any questions on the graphs shown to date yet.

CHAIRMAN GUYAS: All right. I am looking for hands. I will give people a minute or two. I am not seeing anybody. I think you're safe to move on, Dr. Stephen.

DR. STEPHEN: All right. The final few slides are just to kind of think about if carryover is still a consideration of where we're going. I just wanted to remind everyone that the current IFQ system is being migrated.

I do want to tell people that we're getting ready to schedule some outreach virtual sessions about the new system and that we're looking forward to participants within the fishery coming to the outreach, but I also welcome any council member or council staff to start coming to it, and we'll be getting those dates finalized shortly and be sending out notices to people, if they are interested in participating in it. For the fishermen, we are looking for additional participants who would like to help us test the new system.

With the carryover timelines, you remember that we have to calculate any carryover that is considered on December 31, 2020, and that it will need to go through the SSC, and then, if we do have approval for carryover, we'll be looking at, most likely, dispersing that somewhere within the first quarter of the year, and so we'll need a little bit of time to go through the SSC and figure out the math of where the allocation would go and then create the process to distribute it. They would though, of course, get their normal year allocation on January 1.

Again, if we consider carryover, these are the same questions we had before, and we would have to determine which share categories, how much of that allocation we carry over, and who are the recipients, and how we distribute that.

Then the largest one that would have an impact is if we carryover any of the multiuse share categories, making sure that we have consideration of how that impacts things, so that we

don't overshoot the quotas by carrying over multiuse versus carrying it over in the straight category, and those, again, are red grouper and gag that typically end up in the multiuse category. I think that is all, and I'm open for any other questions relating to carryover or the other graphs.

CHAIRMAN GUYAS: All right. Thanks, Dr. Stephen. Are there any other questions on this topic or thoughts on potentially carrying over some quota into next year? I think we're at the point now, since we're at the end of October, that, if this is something that we want to do, we need to make a decision, I'm guessing at this meeting, so that we could get the SSC together and all that before our meeting at the end of November. Leann.

MS. BOSARGE: Thanks. I was just wondering if this is something we're going to look at again at the end of November or not.

**EXECUTIVE DIRECTOR SIMMONS:** Madam Chair, yes, we have that on the agenda for November in the Reef Fish Committee.

CHAIRMAN GUYAS: Okay. Are there other thoughts or questions on this topic? Leann, is your hand up again?

MS. BOSARGE: Yes, and I was trying to lower it and raise it, so you would know, and we're not going to have public testimony at this meeting, and is that correct, Mr. Chair, and then I have a follow-up.

DR. FRAZER: Can you repeat that, Leann? I didn't understand that very well.

MS. BOSARGE: We're not going to have public testimony at this meeting, more than likely, I'm assuming.

DR. FRAZER: We're going to kind of evaluate it, and we're going to try to get the agenda completed with the committee reports, and, if the weather allows, then we will make time for that, but it will be at the end of the meeting, if we do have it.

MS. BOSARGE: At the end of the meeting today?

- DR. FRAZER: No, at the end of the meeting, probably -- It will still be on Wednesday, and it was scheduled for Wednesday, and, if we get through everything and the weather is still favorable, and people are willing to participate, then we'll make time to hear those comments. If not, then we're anticipating that people will be able to provide those comments in a written
- 48 format, and we will summarize them and make sure that we get

them out to the council. Is that okay?

MS. BOSARGE: Yes, that's fine, and I hate that we're not going to have public comment at this meeting. I thought we got some actually very good public comment in both Dr. Crabtree and Dr. Porch's listening session at the last meeting and during our regular public comment, and Mr. Jim Zurbrick actually said something which really is what I have been worried about, which is your smaller guys.

I have been trying to reach out to some of the fishermen, and the bigger guys that are some of your initial shareholders, original shareholders, they've been telling me that, Leann, if you all want to do a carryover, it's fine, and they said but it really doesn't matter to us one way or the other, because we're going to be all right.

I would venture to guess, and they haven't said this, but they own their shares, right, and they were original shareholders, and most of them don't have a big loan on them, and it's a different situation for those smaller guys, which is what Jim Zurbrick was talking about, and he said that I will be fine, but I worry about these smaller guys that have to lease their allocation at the beginning of the year, and you can see that in just this graph.

If you go to the graph on red snapper, towards the middle of her presentation, where she has the blue-dotted lines and the orange-dotted lines, right about there where you're scrolling, and so the graph in the top-right corner, and we've got Week 1 and Week 4, and so, essentially, the first week in January through the end of January, and look how many pounds of allocation is transferred in that first month. You've got four-million pounds of allocation transferred in that first month, and that's what I've been talking about.

The lion's share of your leasing is happening at the beginning of the year, which was prior to COVID, and that's your fishermen that don't own any quota that are your -- I don't want you want to call them, replacement fishermen, and is that what we've been calling them, or next-generation fishermen, and so they have to lease it at the beginning of the year, and those are the guys that I'm a little concerned about.

I was talking to one yesterday, and he said, you know, I don't have a good feeling about you all doing a carryover, and so I've just had to start leasing the quota that I have and trying to find somebody to lease it back to, the pounds that I don't think

I'm going to be able to catch, and I'm leasing it at a loss.

I am leasing it for less than what I leased it originally at, and so let's look at this again in November, and I'm a little worried that, because we've waited this long, that those little guys are already just taking a hit on it, and they're just trying to cut their losses, in case we don't carry it forward, which is -- It bothers me a little bit.

I see what happens in Washington, D.C., where this country has tried to bail out every other industry that we have, and they have bailed out airlines, and we've bailed out cruise lines and everybody, farmers and everybody, and we're doing everything we can to prop everybody up and get them through this pandemic, and this is something that nobody expected. We're not giving money away here at the council, and all we're doing is allowing you to keep the asset that you borrowed money against and get you through until next year.

Anyway, it's a little frustrating that we don't have that same empathy for fishermen sometimes, but I can look at your numbers, and it looks like we're online to catch the quota. The problem is who is not showing up in those numbers, and who is the one that is going to get screwed, and I'm a little worried that it's your smaller guys, and I'm worried they might not make it through it, and that's my spiel for today. Thanks for listening.

CHAIRMAN GUYAS: Thanks, Leann, and I see a couple more hands up. Dr. Frazer.

DR. FRAZER: I just wanted to clarify, for Leann, and so the intent wasn't really to not have public comment. The intent was to try to move through the agenda and make sure that we could finish all of our business, and just simply get that business finished before we had public comment.

Like you, I agree that it's a really important part of the process, and we're just kind of shuffling things around, and, because we don't have any real final action items on this particular agenda, if it needed to go away, it could, and we would provide an alternative way for people to provide input, and so I just wanted to make sure that you understood that.

MS. BOSARGE: Yes, sir, and I didn't think you were trying to avoid public comment at all. I think the hurricane is going to stop public comment, but thank you, sir.

CHAIRMAN GUYAS: Dr. Crabtree.

DR. CRABTREE: I am sympathetic to the concerns that Leann raised, and this has certainly been a trying year for fishermen all around, but the main thing I see, when I look at it, is really the landings, and I think we are on a path to catch the red snapper quota, or come as close as we do in most years, and so I have a hard time seeing the rationale for an emergency, just based on what I'm looking at, and we'll look at it again, I quess, in November.

Bear in mind too that, if you did carry over a substantial amount into next year, it would create a number of distortions and problems with the marketplace for next year, and so it's not like there is no downside to it, but, mostly, I'm just not seeing a large enough loss in landings that I think -- Not enough to justify an emergency, at this point at least.

CHAIRMAN GUYAS: Thanks, Roy. Anyone else on carryover? I am not seeing any hands right now. We'll come back to this again at the late November council meeting, and so we potentially do have another look at this for the year.

All right. Our next agenda item is Tab B, Number 5, Draft Framework Action on Red Snapper. Ryan, do you want to walk through the action guide on this before we do this presentation?

## DRAFT FRAMEWORK ACTION: ADJUST STATE RECREATIONAL RED SNAPPER CATCH LIMITS

MR. RINDONE: Sure. Let me pull that up. For this particular item, you guys are going to get walked through the document by myself, with a little bit of help from John, and it's a look at draft options to modify the Gulf state private angling annual catch limits for recreational red snapper, and it's necessary to correct discrepancies between data currencies currently used to monitor the landings and effort from private anglers.

There will be an option for using ratios to adjust the state survey collected landings back to MRIP'S Coastal Household Telephone Survey, which is the data currency against which the quota is currently monitored and against which a lot of the state surveys have been built, and these ratios have been determined appropriate for this particular purpose by the council's SSC.

The other option is to create essentially an annual catch target, or an alternative annual catch limit, for each state's

private angling component, which would be set at some percentage, in this case 23 percent, lower than what is currently on the books. The council should consider these options and recommend modifications, as appropriate. Martha.

CHAIRMAN GUYAS: All right. I think we're ready to go through this document, whenever you're ready.

MR. RINDONE: All right. This is Tab B, Number 5, and, in the interest of time, there's a lot of background here in the front of this thing, and so I'm going to breeze through a lot of the history that you guys already know, and so we kind of start with the splitting of the recreational sector into the private angling component and the for-hire component, and then we move into the discussion about -- This is on page 1, by the way.

Then we talk about how the disparity between the state and the federal seasons and the federal season getting shorter and the state seasons being longer than the federal seasons and trying to find solutions to that, and, eventually, that leads into the genesis of Amendment 50.

We also talk about, on page 2, the evolution of the NMFS recreational data collection program from the original one, MRFSS, which started in 1979, into MRIP, which was born in 2008, and we also talk about some of the components of that, like the Angler Point Angler Intercept Survey that Dr. Cody talked a little bit about yesterday and the Fishing Effort Survey, which took over for the Coastal Household Telephone Survey, which you guys have heard a lot about over the last few meetings and the SSC had a couple of workshops on.

Generally, the landings and effort estimates coming out of MRIP-FES are greater than those from MRIP-CHTS, and this is due to sample coverage and accounting for some biases from CHTS, like the wireless effect.

 Then we talk about Amendment 50, and, in Table 1.1.1, it shows the current percentage of the total private angling ACL that is allocated to each state and what that means for that state in pounds for 2020 below that, and then we go and we talk about the different state data collection programs. For Florida, it's the Gulf Reef Fish Survey, which is now, as of July, the State Reef Fish Survey, and Alabama is using Snapper Check, Mississippi Tails 'n Scales, and Louisiana is using LA Creel, and Texas Parks and Wildlife is using the Marine Sport Harvest Monitoring Program, which is also a creel survey.

Why is this calibration to a common currency necessary? It's because the different states are collecting these catch and effort data, using their surveys, and these surveys, because of the way they collect this information, they're not directly comparable to one another, but, in the case of Louisiana, Mississippi, Alabama, and Florida, these surveys were developed against, and calibrated against, the MRIP Coastal Household Telephone Survey, and all four states have had their particular surveys certified as appropriate for their purpose by MRIP.

Again, it's important to remember that certification by MRIP does not mean that NMFS considers these to be the best scientific information available, but rather that they are appropriate for the purpose for which they are being used.

What needs to happen here, in order to be able to monitor the catch and effort against the currency in which the quota has been established, and, again, that was MRIP-CHTS, based on the projections from the SEDAR 52 stock assessment, some sort of calibration, or adjustment, is necessary, or some amount of buffering is necessary, to ensure that states don't exceed their ACLs and then end up triggering accountability measures.

There's been some workshops held by the NOAA Office of Science and Technology and hosted by the Gulf States Marine Fisheries Commission to try to take some swings at this and come up with some solutions. The most recent was on August 5, and that was to clarify processes and methodologies, and I'm still on page 5 by the way, that was to clarify processes and methodologies for developing these ratios, and this was a collaborative effort between the NOAA Office of Science and Technology and the Gulf states.

The SSC, subsequently, reviewed these ratios, on August 11, and they found them to be appropriate for the purpose for which they were intended to be used, and we talk a little bit about each state's approach in there as well. Ultimately, the recommendations from that workshop are shown in Table 1.1.2.

 The purpose of this action is to reduce the likelihood of exceeding the red snapper private angling component ACL by adjusting the state catch limits to account for the monitoring programs used by each Gulf state. The need for this action is to use the best scientific information available to prevent overfishing while achieving optimum yield, consistent with the red snapper rebuilding plan.

The lengthy history of management for red snapper follows next,

which I will not go through, and that brings us to our management alternatives in Chapter 2, and I will pause there, Madam Chair, to see if there are any questions at this point.

CHAIRMAN GUYAS: All right. Are there questions for Ryan? I am not seeing anything.

MR. RINDONE: All right. Well, then we will keep moving forward, Madam Chair. Action 1 here is to modify the Gulf of Mexico state-specific red snapper private angling component annual catch limits, and so Alternative 1, the no action alternative, would retain the state-specific red snapper private angling component ACLs established in Amendment 50A of the Reef Fish FMP, and those are all shown below in that table, and those are in pounds whole weight.

Alternative 2 would modify the state-specific red snapper private angling component ACLs using the ratio corrections developed by NOAA OST and the respective Gulf states, and these ratios and the resulting ACLs in each state's currency are shown in that table.

Then Alternative 3, which is on the next page, would modify state-specific red snapper private angling component ACLs by establishing a state management ACL that is 23 percent below the private angling component quota and applying the allocation percentages established in Amendment 50A. The resulting state ACLs would be as shown in the table under Alternative 3, and each of those ACLs is in that state's respective data currency.

Generally speaking, Alternative 1 is what brought us here in the first place, and so you guys should presume that that alternative is not viable, because it would continue to allow monitoring of some states' landings in a currency that is not comparable to the ACLs, which could result in total landings of red snapper exceeding the ACLs for those states, and the total private angling component ACL, and so, knowing now that we know that, we can't continue to do that, because it would be in violation of Magnuson to allow that to continue, and so Alternative 1 is not viable.

Alternative 2 would apply the ratio adjustments, and, in Table 2.1, you can see the difference there between the current state ACL and the converted ACL in the state's currency, using that conversion ratio. Based on the ratios, some states would end up with more fish than they are currently counting, and some states would end up with less, and, in the case of Texas, it would go unchanged. Alternative 3 would establish that state management

--

CHAIRMAN GUYAS: Hang on. I think Susan has got a question on something you just said. Susan.

MS. BOGGS: Well, it's kind of a general question, because we had some discussion, at the last meeting, and we haven't heard anything on this Great Red Snapper Count, and so I just don't feel that we have all the details to be making these decisions, because, if that's going to change what we do here -- I know we need to do something, and don't misunderstand what I'm saying, but it's just are we jumping the gun before we get the results of the Great Red Snapper Count, and I don't know when we're supposed to hear a presentation on that.

I have been hearing rumblings that the numbers are great, and there's more fish out there, and so I don't know how it affects this, and I just don't know if we have all the pieces and parts, and then, of course, at the end, when we get all the details, if you will, we'll be looking to see how is this going to affect the charter/for-hire fleet when we make this decision, and I'm just curious about the Great Red Snapper Count and how it feeds into this. Thank you.

CHAIRMAN GUYAS: I think that question is on a lot of people's minds, and I'm hoping that we can talk a little bit about that today. That's just one of the many things that are in play right now that essentially affects this amendment. Roy, I see your hand is up.

DR. CRABTREE: So think back to the last council meeting, and I can't remember if this was in the motions, but the council expressed that its intent was to deal with the calibrations and the revised catch levels based on the interim assessment that is to be based on the Great Red Snapper Count simultaneously. I think that you could ask Greg and Clay, maybe, for an update on timing.

Generally speaking, my understanding is that the Great Red Snapper Count indicates that the population is quite a bit larger than previously believed, and so it seems not unreasonable to believe that the quotas will be increasing.

At any rate, Susan, the intent of the council right now is to have all of this information before you when you make a final decision, which hopefully will occur either at the January or the March/April meeting, and then, if the catch levels are going up, it would be more palatable, I would think, to implement a

buffer or something like that, because you may be able to deal with that and still have more fish available than you've had in previous years, but, at any rate, I think it is reasonable to expect that the quotas are going to be increasing, and I don't know by how much, and I think, in order for you to increase the quotas, you will have to make sure the plan is compliant with all of the aspects of the Magnuson Act, and that means, as we laid out in Amendment 50, you have to deal with the calibration issue, or I don't see how you can raise the quotas.

I think they're all part and parcel of one thing, and hopefully you will be able to deal with those fully next year and in time to get the new catch levels in place going into the 2021 fishing season.

CHAIRMAN GUYAS: Susan, did you want to respond to that?

MS. BOGGS: Yes, and thank you for that, Roy, and that makes me feel a little bit better, and I'm not trying to -- I know you've got to get through the document, but I was concerned that we were going to make some fairly hard decisions today, but it sounds like we have a little bit of time, meaning the January council meeting, and so thank you very much.

#### CHAIRMAN GUYAS: Paul.

DR. PAUL MICKLE: Based on Roy's comments dealing with calibration, I wanted to dive into that, just briefly, and I know that everybody is eager to hear what Greg has to say, and so I will tee it up, but I would like to ask about calibration of -- There was discussion of a calibration panel or something being put together, and I just wonder if there's an update we can get from that, if not today, by Richard Cody, or maybe tomorrow at Full Council, of where we are in that process, because, as you all know, Mississippi is very eager to look at alternatives for the current calibrations that have been going on.

 We feel that we have been -- Our survey has been a little bit misrepresented, and there have been comments, and there were comments on the record by the SSC, which drives the best available science, and the Tails 'n Scales program is really not even a survey, and it's more of a census, and I feel that it needs to be represented in a different calibration methodology.

I did my best to come up with new methodologies during the workshop, as well as the SSC meeting, and, also, we just feel that -- I understand the rush and everything, but it's obvious

that the Tails 'n Scales system is not being properly represented in the calibration process, and we are looking at the largest hit, the largest reduction, and potential paybacks, and we just really feel that we need to have a little bit more delving in, and I'm not talking about the Great Red Snapper Count yet, as far as this topic, and I'm talking about calibration, which Roy brings up that we have to deal with, and I'm sorry to talk about just my little state, but I just feel -- I've been frustrated, and I have voiced my concerns, and I would like to see --

I think NMFS has made a good effort to keep working on it, and they have made a lot of statements that this is a process, and this was a first cut calibration, but, again, there's a lot more fishing holes to fish in to look at, as far as methodologies for calibration itself, and having the Tails 'n Scales system properly, in a quantitative sense, being represented, as far as accuracy within the calibration process. Thank you.

CHAIRMAN GUYAS: Thanks, Paul. Richard, can you respond to that?

DR. CODY: Sure. I will try to. I think what Paul is referring to is the transition team working group for the Gulf, and so that would be made up of representatives of the Science Center, the Regional Office, S&T, but also the states and the Gulf States Commission. Those are members that are already on the transition team for the MRIP survey, and so they have experience with calibration processes.

The things that that working group were hopefully going to address is looking at, as more data become available, the potential to revisit calibration at a later date, and then also accessibility of data, research plans, and we talked a lot about looking at the drivers for the differences between the surveys, to get a handle on why you get different estimates, but I don't know if that answers your question.

 The other thing is that the plan is to wait for this meeting to finish and then to convene a meeting with our transition team working group, possibly I would say the latter half of November, at this point.

CHAIRMAN GUYAS: Thanks, Richard. I'm going to go to Greg, because I think everybody is waiting for Greg to give us a little update on the Great Red Snapper Count.

DR. GREG STUNZ: Thanks, Martha, and, if everyone recalls the

last time, we were just ahead of some congressional briefings, which I had some obligations to meet about informing them and briefing them on the Great Red Snapper Count that I couldn't do before the last meeting, and so I'm happy to generally update you here.

Of course, I am working with -- Our team is working with Clay and his shop, as well as I'm happy to present formally to this group whenever the Chairman thinks we're ready to do that, maybe at our next meeting or something like that, and I don't know, but, to give you an idea, before I tell you sort of where we're at, and I mentioned this last time, I don't think -- Putting more fish to this problem isn't going to fix things. It certainly would make the controversy go down, because maybe there wouldn't be short seasons or something, but it's still not really affecting the underlying problems.

I guess, to give you some idea of where we're coming in, we're looking at roughly tripling the federal estimate of abundance that's roughly around thirty-six million fish, is the federal estimate of how many fish are out there, and so we're going to be substantially above that.

 We're putting the finishing touches on our final report, and we should be done here in a few weeks to a month, and I've had a lot of communications with Clay and his team about what's the best way to integrate that, and, obviously, this needs to go through our SSC and all that kind of thing, and so there's some procedural things that will need to happen, but the good news is that there is a lot more fish out there.

The other thing though is I'm just a little skeptical about using that to fix these other problems, and then, to add one last thought to that, by having this real abundance estimate, it's a big difference in the way that we can do assessments, and Clay is really the person to talk about that, but we have a lot of moving parts going on, with the effort adjustments in these particular fish and different ways to do when the next big research track full assessment comes along, and so there's a lot of moving parts in the air to sort of move hastily, and so that's why I've been very cautious about this framework action here and not getting too ahead of ourselves.

The last thing is, you know, at some point -- It seems like we're always changing down these recalibration issues on a variety of fronts, rather than really stepping back, when we get all this new information, and maybe coming up with some different assessment methodologies and running those side-by-

side, and I clearly understand there's a need for these long time series, but, at some point, we've got to figure out are those really accurate and where we need to be going and start creating some new time series and running these estimates sideby-side and sort of ease in all this new information.

6 7

8 9 I will go ahead and stop there, but it's all positive news, but I just don't want us to get in front of ourselves by not really utilizing some of the new information that's out there and just temporarily fixing a problem.

10 11 12

CHAIRMAN GUYAS: Thanks, Greg. I appreciate that update. We've got a number of hands up, and so I'm just going to work our way through the list here. Next, I have Dale Diaz.

14 15 16

17

18

19

13

MR. DALE DIAZ: Thank you, Ms. Guyas. Thank you, Greg, for that update, too. I guess I have a question. I think some people might be wanting to hear from Clay, and so I don't know if you want my question now or you want Clay to respond or follow-up on what Greg said, and it's up to you, Martha.

202122

**CHAIRMAN GUYAS:** I guess if your question is for Clay, go ahead and ask it.

232425

26

MR. DIAZ: It's for Dr. Cody, and it's based off of some of the stuff that Dr. Mickle was talking about earlier, and so it's changing topics.

272829

CHAIRMAN GUYAS: Gotcha. Okay. Well, let's go to Clay real quick then, and then we'll bounce back up to you.

30 31 32

MR. DIAZ: Thank you.

33 34

35 36

37

38

39

40

41

42

43

44 45 DR. CLAY PORCH: Thank you. As Greg mentioned, we've been in conversation with he and his team, and, as he also said, the Great Red Snapper Count estimates about three-times as many red snapper as the assessment did, but I feel like I want to manage expectations a little bit, because two-thirds of the red snapper population is estimated to be outside where most of the fishery operates, basically on that uncharacterized bottom, which a lot of it is very low relief, or no relief, what the fishermen say is out on the mud, and then there just may be little pieces of stuff, little holes here and there, that red snapper will congregate around, but it's a low-density area that fishermen don't usually fish in, but it's huge in area, and so you multiply low density by huge area and you get big numbers of red snapper.

47 48

Even though the population is three-times bigger, it won't necessarily translate into a three-times bigger ABC. The picture we're starting to get is that there's a lot of local recruitment in the red snapper population, and it's this sort of Gulf-wide recruitment, and that's why we saw the serial depletion that went on since the inception of the fishery, where they would fish down areas, and it would take a long time for them to come back, and so they just started fishing farther and farther away.

In fact, places like the Dry Tortugas still haven't quite come back, and there are some red snapper there, but, if you go back to the early 1900s, that was one of the centers of the fishery, at least in U.S. waters, and so it's more complicated than it sounds, but certainly this has been a fantastic study, and we're all really excited about it.

We have some suspicion, based on commentary from folks like Wayne Werner and Donnie Waters, who used to always tell us there were fish out on the mud, but we didn't have any way to really prove how many there were out there, and so this is the first study to do it.

In fact, it's really unprecedented. Nobody in the country has done anything like this, to get an absolute estimate of abundance of any particular species in the way that they had to do it, because, although in a few places on the west coast they've gotten counts of animals out there, it's been kind of a homogeneous environment, and they could use one gear to do it, whereas, here, they had to use multiple techniques, because the Gulf is so different, in terms of visibility and such, that they had to use cameras, and, in some places, where the water is clear, acoustics.

Where it wasn't so clear, in other places, where acoustics didn't work, they had to use depletion studies, and thev stitched them all together and came up with some fantastic information that I think the assessment will benefit from tremendously, but I say all of that just so that people kind of understand that this is -- It's not that there were more fish in the areas where fishermen were saying, assessment actually got that number really closely, and the assessment and the Great Red Snapper Count agree very closely, in terms of the number of red snapper that exist in places where people fish, the artificial reefs and the high-relief natural It's just what the assessment missed is where people don't go much, and that's that low relief.

Having said all that, the only thing that I would add is we're working very closely with Greg, and he's going to, I think, and he can clarify, but I think he's planning to put out a report sometime in November, and report at the next council meeting on it.

At the same time, our staff will be working with him to get a better idea of all the nuts and bolts that went into that study and what exactly they have. For instance, right now, we've seen estimates of age-two and older total abundance, and what we need to do now is partition that up by age class, and then we'll have a way to move forward to get ABC estimates, and so I don't think we'll have it by the January council meeting, since we don't actually have the data yet, but I anticipate that we'll have estimates sometime in March, certainly in advance of that next council meeting.

CHAIRMAN GUYAS: Thanks, Clay. That's helpful to our timeline here, and I appreciate that. I'm going to go back to Dale.

MR. DIAZ: My question is for Dr. Cody, talking about the transition team that's going to be doing some work. Dr. Cody, in one of the meetings that was held over the summertime, leading up to the calibration -- In the report provided by the meeting, it talked about unique problems for small states and if there needed to be some work done to deal with some of the unique issues that small states have. Is this transition team the team that's going to take care of that, or do we have a plan to get a group together to look at that recommendation?

DR. CODY: Dale, I would say that the transition team working group -- That would be on the table for them to discuss, and, as I said, there should be representation from each of the states, and so, if that's a priority to discuss, in terms of calibration, and I assume it is, then that would be something that that team could tackle.

MR. DIAZ: Thank you, Dr. Cody.

DR. CODY: Sure.

42 CHAIRMAN GUYAS: All right. Dr. Mickle.

DR. MICKLE: Thank you, Madam Chair. I just wanted to thank Richard Cody for giving the update on the next steps and the integration team, I guess we're calling it, and I think it's a good thing to delve in and take a more quantitative approach in looking at some transition calibration efforts, at least for

small states such as Mississippi.

Then, last, I will just circle very quickly to Clay's comments, and it sounds like -- I haven't seen the study, and I tried to listen to the briefing, the congressional briefing, and, without getting too far down in the weeds, it sounds like a possible inference, with any data, and just anecdotal from what I've listened to thus far, is that maybe all these snapper in very low density on very, very large spatial areas of bare bottom could help explain why the snapper population bounced back so quickly, and I guess caught us all off-guard, and we were all wondering why it came back so fast, and trying to explain that, and I know there's nothing behind that statement, but, again, as a scientist, I like to think about why we're seeing things and trying to explain possible early results, where I've caught pieces here and there.

The slow rebounding of the Tortugas is maybe some regional complexities there, but, with those comments of density and fishing and different types of habitat, and it's very hard to catch them in these bare-bottom areas, and those are all accurate, I guess, but, last time I checked, it's managed as a Gulf-wide stock.

I wish it wasn't, but it is, and I don't think what matters what habitats there are, if I'm correct in the MSA about how to do management, and it's a Gulf-wide stock, and it doesn't matter the density by habitat, I'm assuming, and a lot of those comments seem to lead toward regional management, and, if we're looking at density and biomass by region, then we should, because it sounds like NOAA has the data to do that.

If we're going to manage that way, I guess we need to talk about it, but it seems like it's coming up now, and maybe we need to delve into it down the road after all, just looking at different biomass densities by region, because it seems to be coming up on its own, and so I just wanted to make that comment.

CHAIRMAN GUYAS: All right. Thanks, Paul. Next, I have Dr. Crabtree.

 DR. CRABTREE: Just a couple of comments, to Paul a little bit, and, yes, I think the outcome of this study does have a lot to say about why we saw such law recruitments when the stock was fished down to very low levels, and so I think we learned a lot about that.

I think, Paul, that you're right that there will be further

refinement of the calibrations, because the surveys will continue to go side-by-side, and, as we get more and more data, I'm sure that they will be refined and things, but that's not going to change the fact that we have the best we can do at the moment, and we're going to come in next spring, and you're going to want to adjust these catch levels, because, based on everything we're hearing, the expectation is that the quotas are going to go up, and they may go up substantially, and that's going to mean not just the private rec quotas go up, but the commercial quota and the for-hire quotas will go up.

I think you're going to have some urgency behind getting this done quickly and getting it done in time to affect the next year's fishing season.

Now, it doesn't have to be that the calibration affects any one state much harder than the others. I know, if you just apply the straight ratios, it affects Mississippi and Alabama the most, but that's not the only way to do this, and you could effectively buffer it across the Gulf, and everyone takes a similar reduction, but, if the catches are going up, it may not be a reduction.

What it may be is the way to look at this is the catches are going to go up, and they may not go up quite as much as they otherwise would have, because we're going to need to buffer it to adjust for the fact that we have all these different surveys, and they are not all comparable with each other, and so, while I agree with Greg's statement that just having more fish doesn't fix everything, if what you mean by that is that it still leaves us with multiple surveys, and the issue of how we compare them all and what we use in the assessments in the future, those issues are there, but having more fish may mean that no one takes a cut, and, in fact, everyone's catches go up, and all we have to be is a little more precautionary and factor in a little more uncertainty to account for this. Thank you.

## CHAIRMAN GUYAS: Kevin.

 MR. ANSON: Thank you, Madam Chair. I have a question for Dr. Stunz, and that was the primary reason for raising my hand when I did, but there have been a couple of folks who have made some comments, and I will address those. I want to comment on those first.

The Great Red Snapper Count shows that there are more fish out there, and they are fish that they weren't sampling in, or didn't take into account, and so the way I look at it is it's almost a de facto MPA and that those fish are essentially just going to be out there, and, when we raise, or when the OFL is raised for everybody, we might come to a point, for some reasons, that we could have nearly a year-long fishery, because folks are not going to go and try and drift around waiting to hook one of those few fish that are scattered about in those uncharacterized bottoms, and so it's going to be very interesting to see how the fishery then changes with the change.

At least for Alabama, there's a lot of fish that are caught on artificial reefs, and our data is showing that, once those fish are kind of dropped down in numbers, it disincentivizes a lot of folks to go fishing, and they go find other things to do, because they're not so easy to catch. The effort goes down, and your season goes up, and so it will be interesting.

I take a little bit of exception to the comment about those fish just weren't there, and nobody had any information about it, and Alabama has been doing a habitat-based survey since 2011, and we've been sampling those uncharacterized bottoms, and we identified that there were fish out and about, scattered about, and so we had some data.

I am picking up on Paul's comment about this provides, or opens the door, for us to look at things differently, and it allows managers to look at the fishery differently, potentially, and it allows the scientists to look at the fishery differently and to take into account some of the biological parameters that are used in the assessment and some of the assumptions that are made about this fish, which oftentimes are correlated with other snapper fish in other parts of the world, and this may not be the appropriate thing to do, but it's good to have this data as a backdrop and as a reference, so that those things can be reevaluated.

My question, I guess, goes back to this issue of timing, and it was, at the last meeting, stated that it was the desire of several of the folks around the table to wait for the numbers from the Great Red Snapper Count to be incorporated into this interim analysis and then brought back to the council as part of this conversation with calibration.

I appreciate that Dr. Stunz and all the researchers that put the time and effort into studying the fishery, or at least the fish, and creating the abundance estimates, and I appreciate his concern for making it right and everything, but I'm just wondering, Dr. Stunz, if you can answer why -- Or what's the issue of just providing the data right now?

Oftentimes, scientists are concerned about sharing data when things aren't published yet, but I don't think the Science Center has any desire to take the data and publish with it, although there are some employees that are on there that could co-author currently, but I'm just wondering why can't the data be transferred right now, and why does it have to wait until the report is completed? Thank you.

CHAIRMAN GUYAS: Greq, do you want to --

 DR. STUNZ: Kevin, the reason is because we want to make sure that we've dotted every I and crossed every T and that our estimates are thoroughly vetted and that sort of thing. We've got a final report that lists all the nuances of the project and what are the pros and cons and where are we very confident and where are we not and that sort of thing.

That is where we are at with the team, and so our team was very skeptical to release any detailed data ahead of that, but we're getting very close here, and that's why I mentioned that I would be happy to present this at the next meeting. I don't think that would have time to have gone through the SSC, because, obviously, we want to have a final report and something that they can look at. There is much more to it for an evaluation like that, in terms of how it was done and that sort of thing, that I think needs to get done, but that's the short answer to your question.

I just wanted to briefly comment to what Paul said. The estimate will come back -- We were charged with looking at a density by region by habitat, and we'll have that information, and our regions, loosely, or not -- More than loosely, and they are almost perfectly matched up with state regions, and so that will be useful, from that perspective, and I also want to say that, because those fish -- The story really is that the fish are in high abundance over that uncharacterized bottom, but it doesn't mean the fish aren't still in very high abundance on your traditional high-relief snapper banks that everyone knows about, and, of course, artificial reefs, and that's still the case.

43 Also, we're talking about fish, and I agree, Kevin, that it's 44 sort of you've got a de facto marine reserve out there, 45 essentially, but those fish aren't evenly dispersed over that 46 bottom. They are still reef fish and structured oriented.

There's a lot of zeroes out there, and then, all of a sudden,

there's a lot of fish that's holding over some unknown structure that happens to occur there, but, when you average that out, it's generally low densities overall, but they're out there over high densities, but it's just very, very patchy, and fishermen can exploit that.

I mean, that's why they guard their books so hard. They probably know about these so-called secret spots that just are unmapped, or unknown, and that's what makes up that uncharacterized bottom, and I don't want anyone to think that these snapper are just evenly dispersed over a mud bottom, and so I just wanted to clarify that too, Martha.

CHAIRMAN GUYAS: Thank you, Greg. All right. Leann has been waiting patiently.

MS. BOSARGE: Thank you, Madam Chair. I have several questions. I will start with Greg, and so he's on the hot seat, I guess. Greg, what I hear you saying -- I guess you gave like a preliminary report to Congress, and so now you're trying to put the finishes touches on the final report, which is similar, I'm assuming, to the final reports we get from a stock assessment, and so that is what we would have for the SSC to review, and it sounds like Clay and his shop would need the final report, and then it sounds like they need quantities of fish divided up by year class, and I don't know if you've done that yet, and so that's my question.

When will the final report be out, and then how much longer after that will it take you to the get the data partitioned the way Clay would need it, so that we can kind of use it for management?

DR. STUNZ: Martha, do you want me to answer that?

CHAIRMAN GUYAS: Sure. Go ahead.

 DR. STUNZ: Leann, yes, you are correct, and so we were charged with looking at the abundance of age-two-plus snapper, and, while that's useful, that doesn't help Clay from the interim assessment, and he needs that broken down by age class, and we have that data pretty handy and ready to go, and that's not a time constraint.

Our issue is getting the final report done for exactly what you're saying, and our target date right now is to pretty much have that done before Thanksgiving, and, as I have mentioned many times, there is no one in the entire Gulf of Mexico that

wants to get this report out and done faster than I do, and so we want to wrap this up, but, just so everyone knows, in a perfect world, we wouldn't have done those congressional briefings ahead of time, but we were getting too much pressure, and that pretty much just had to be done, for all the reasons we're talking about here and the contentiousness going on in the fishery.

That's been done, and, of course, once we have our final report, there will be a big roll-out program, and I will present to the council here and explain this in detail and what it means and that sort of thing, and then, in the meantime, working with Clay and his team, so we're ready to go and integrate this into the process, once it goes through the SSC procedures.

One last thing is, Leann, not technically, no. This is not a stock assessment, and so it will be similar, in terms of abundance by habitat by region, but this was not a stock assessment, in the true sense of an assessment that's generating yield streams and that sort of thing.

This was just characterizing the abundance of red snapper in the Gulf of Mexico, and so it will have similar outputs, and very fancy graphs and things, but it's not a stock assessment like that. Clay will integrate that abundance in an age-structured format that will go into an interim assessment.

**CHAIRMAN GUYAS:** Leann, did you have more questions, or a follow-up?

MS. BOSARGE: Yes, and thanks, Greg. I didn't think it would be those type of outputs. My thought process was it's similar to a stock assessment report, in the sense that it's probably going to be several hundred pages, and all the pieces of data that you gathered and then stitched together will be there for people to parse through, if they would like to, similar to a stock assessment report, and then, Madam Chair, can I follow-up with my second question?

CHAIRMAN GUYAS: Go ahead.

MS. BOSARGE: This one is for Dr. Cody, and it's, again, on timing. The transition team, or integration team, and I'm not sure what you call them, but I'm wondering when your next meeting is going to be, and I am looking at the red snapper research track that's going to start in 2/1/2021, and so that's about two months from now.

I haven't gotten a good read yet on whether we're going to be using state landings data streams, back-calibrated, in that stock assessment or we're going to use FES in that stock assessment and then, once we get FES out, we're going to have to do this whole conversion thing again and get conversion ratios for FES to the state currencies, but, regardless of which way we're going, I think this integration team better hit the ground running pretty quickly. I mean, we don't want to be, at the last minute, trying to figure and hash all this stuff out.

DR. CODY: Leann, I would agree. I mean, we were hoping to get a meeting together by the end of mid to late November, to get things rolling, but the group itself is really advisory in nature. I mean, they will look at things, like, for instance, the desire to revisit calibrations as more data become available and those kinds of questions, as well as the accessibility of data and transparency and other things like that.

I would defer to Clay for decisions related to what is going to be looked at, and Roy also, in terms of the assessment process, but I would imagine that, realistically, since the two data streams are going to continue for at least the foreseeable future, the team will have a role in determining what are the for drivers the differences and other research-related questions, and, if there is a value in having input to the assessment process, maybe that could be addressed as well, but I would think that the real thing is to have coordination between the states and NOAA with respect to questions that remain out there in terms of calibration.

 MS. BOSARGE: Thank you, sir. If we're hoping to get something on the books by March or April, then it's got to be done by January, so that we can see it, and so I would encourage you to get that team together and meet as soon as possible. Otherwise, we've just got what's in this document and that's it.

 DR. CODY: We will do that. I will say that, for the purposes of the 2021 catch information, we've done all we could do, and what we had was what was available to us, in terms of calibrations. Going forward, there are other options that might be available, if the desire is there on behalf of the states to revisit those calibrations.

44 MS. BOSARGE: Madam Chair, I have one final question.

CHAIRMAN GUYAS: Go right ahead.

48 MS. BOSARGE: All right. This one is for Roy. You're up. Tell

me again -- We know we went over the OFL last year, and that would have been 2019, and did we go over the OFL in 2018, or is it just 2019? I am trying to figure out how many years we overfished.

DR. CRABTREE: Well, if I could, Madam Chairman, we were over the OFL in 2019, and I do not recall, and I do not believe, that we were over in 2018, and so that's the problem. Technically, that means we were overfishing in 2019. Now, clearly what comes out of this interim assessment and the Great Red Snapper Count has bearing on that and may change our picture of that.

The other problem you have though is we have exceeded the recreational quota, I believe, for four straight years, and recall Section 407(d) of the Magnuson Act, which says you have to have quotas, and you have to close the fishery when they're hit, and so that's another problem that we have that we need to address.

Then I want to agree with Richard. What you have in this document is what you're going to have to make your decision on in the spring when you're changing quotas, and I don't think that anyone should expect much to change with respect to the calibrations in this timeframe, and so we're going to get new catch levels that come out of this interim analysis, but I think this is what we're going to have, in terms of the calibrations.

Now, you may get new information a year from now, or when you get the next benchmark assessment, that enables you to re-look at all this, but, between now and the spring, I don't envision that happening.

**CHAIRMAN GUYAS:** Roy, you mentioned -- Obviously, we went over the OFL in 2019, and we've talked about that, but you also said there was overfishing in 2019, and is that now -- Has that been officially determined by NMFS at this point?

DR. CRABTREE: There has not been an official determination, nor has there been a notification to the council at this point. That may happen, but I don't know when, but I think what you need to focus on is we have to deal with the calibration issue, and we need to do this as quickly as we can.

I understand the desire to deal with the Great Red Snapper Count and the calibration simultaneously, and okay, but we need to move as quickly as we can and get it done, and we need to think through the decisions we're going to make and how you want to do it and what you want to look at, so that staff is able to pull

it together, so that, when you get the new catch levels in the January or the March meeting, you're able to make a final decision and move forward, and I suspect what you will end up doing is some sort of temporary rule, or interim rule, in order to implement the new catch levels in time to affect the season.

CHAIRMAN GUYAS: Thanks, Roy. Leann, I think that's the end of your questions, and is that right, or do you have a follow-up?

MS. BOSARGE: Yes, ma'am. I'm good. Thank you.

CHAIRMAN GUYAS: Okay. Clay, I see your name on the list, and I don't know if you've already made your points or you have more.

DR. PORCH: I have a couple more, in response to some that were made, and so thank you, Chair. One is to Richard's point and the question about what currency we would use in the interim analysis, and I don't see us going to FES for that, because it could be that we'll use some elements of the stock assessment in combination with the Great Red Snapper Count, for instance the estimate of the fishing mortality rate that gives a 26 percent SPR, which is the MSY proxy that's on the books.

That could come from the assessment, and, if that's the case, that's really in a CHTS currency, but we'll kind of -- We'll give you more information on that as we start working with the Great Red Snapper Count data.

When we get to the stock assessment, currently, the only time series that is calibrated back in time is FES, and that's not to say that there won't be any further developments by the time we do that research track stock assessment, but it gets very tricky though, because some of the state surveys, for instance Alabama Snapper Check, only give us the landings during the open season, and so we don't know what the discards are throughout the year, and so we end up having to use something like MRIP for that, and so it's going to be a long and complicated discussion, when we come to the stock assessment, and I don't know for sure which way that's going to go.

The other thing that I wanted to comment on was Mr. Anson's point about the uncharacterized bottom, and I didn't mean to imply that none of us knew anything about there being fish out there, if only for the fact that we've been running a longline survey out there for over twenty-five years.

In fact, many of you may know that we've been criticized about that for many years, and why are you fishing out there, and

there's no red snapper out there, and it turns out that's where most of the red snapper were. The problem is, until the Great Red Snapper Count, we had no way to quantify the relative abundance of fish out there. We knew they were out there, and we would catch them on longlines, but there was no way to calibrate it with our measures of abundance inshore, and that's the trick.

We knew there were fish out there, but we just couldn't prove that there were more fish out on that uncharacterized bottom than there were on the high-relief areas, and that's what I was trying to say, and so thanks.

CHAIRMAN GUYAS: All right. Thanks, Clay. Leann, is your hand up again?

MS. BOSARGE: Yes, and it's just to make sure that I understood Clay, if I can ask him real quick.

CHAIRMAN GUYAS: Sure.

MS. BOSARGE: Clay, you said, for the upcoming red snapper stock assessment, we might use state data, the different state data surveys, but we'll have to use a little bit of FES to fill in the holes, like you said, if they don't have discard data that is all year long, and you will have to use FES to fill in those holes, but it is possible that you'll be using state data landings for that?

DR. PORCH: I emphasize the "is possible". I don't want to guess exactly where we're going to go by the time we are conducting that assessment, and hopefully a lot of water will run under that bridge and we'll learn some things between now and then, but it's possible that we could use some of the state data, but it won't be as simple as just using state data, because there's gaps in the state data, but, to do that, we would have to find a way to calibrate the catch estimates from the states all the way back in time, and, to this point, there hasn't been a whole lot of work there, and I'm not even sure exactly how that would be done, but it would have to be done if we were going to use state data in the stock assessments.

You can't use say FES back in time and then suddenly shift to the state data, where the estimates are much lower, because that just looks like you had a decrease in fishing mortality, when, really, you're just changing metrics, and so there's a lot of technical things wrapped up in that, and I don't want to go into too much detail here, except to say the research track assessment will look very carefully at those sorts of details and how best to use the state and federal data.

CHAIRMAN GUYAS: Thanks, Clay. I think we're at the end of our speaker list here, and so let me just try to summarize, I think, where we are here. Clearly, we're waiting on a lot of information from the Great Red Snapper Count and the details of that, and we're waiting on this interim analysis.

We've noted that we could have Greg give a presentation on the Great Red Snapper Count at our next meeting, and so check on that, and that interim analysis -- Maybe we would be able to look at that either in January or March/April, and it sounds like the timeline is still a little bit in flux there, and then the council potentially would be taking some sort of action on this document at either of those meetings, again dependent on the results of when the Great Red Snapper Count stuff is available. We also have a potential overfishing determination maybe in sight here, but nothing yet on that. Roy.

DR. CRABTREE: Well, it seems to me that the biggest decision with respect to this document that you're going to have to make is do you want to go down the approach of applying the calibration ratios directly, which will hit Alabama and Mississippi the hardest, or do you want to do something like a general -- I guess a 23 percent buffer that reduces the overall catch level down to account for the inherent uncertainties of having all these different ratios.

I guess we're going to go through the rest of the document and see that, but it be worth having some discussion of the merits of those two approaches and any others you can think of that you want staff to try and look at, or is there any other way of looking at it that you would like.

CHAIRMAN GUYAS: Right. We didn't get all the way through the document, and I think we cut Mr. Rindone off to have this discussion, and I was going to go back to him, to see if there's anything else that he wants to take us through in this document. We don't need to make a decision about which alternatives today, but certainly, if there are others that people want to bring to the table today, I think staff would welcome that, and so, Ryan.

MR. RINDONE: Still here. There's something that I did want to poke a little bit about, is the recommended 23 percent buffer in Alternative 3, and just to ask that SERO expound a little bit on how that particular percentage was determined and what data were used, et cetera, just for you guys' edification. I am lobbing

that particular one towards Roy and his shop.

CHAIRMAN GUYAS: Right. Roy.

DR. CRABTREE: I can tell you generally what I think was done, is you look at what's the overall reduction you get if you apply the straight ratio, and then that comes out to be approximately 23 percent, and so, if you apply that across the board, like the other one, but, in terms of the default of how it was calculated, I don't have that, and I can't see the whole list of who is on that could explain that more fully, but there may be some of my staff on. I think, Ryan, as we develop this and come back next time, that's something that needs to be fleshed out and described in the document.

CHAIRMAN GUYAS: That would be nice, and I see Peter Hood's hand is up, and hopefully he can give us a little bit more information. Peter.

MR. HOOD: Thank you. Could staff scroll down to Alternative 3? I don't know if there's a table down below there, but, basically, what was done is our staff, Jeff Pulver, basically, iteratively, started reducing, or creating, a buffer, and so he started at 10 percent, and he went to 15, and so forth, and, after you apply the buffer and calibration, if you take basically the totals, in CHTS units, at 23 percent, you get just below what the private angling ACL is,

Basically, it was just a situation where, at 20 percent, you were over the ACL. At 21 percent, you were still over the ACL. At 22 percent, you were over the ACL. At 23 percent, you were just under the ACL. Of course, at 24 percent and so on, you would then be even more reduced from the ACL, and so it was a simple iterative process, and 23 percent is the level that got you just under the private angling ACL in the CHTS units. I hope that makes sense.

**CHAIRMAN GUYAS:** Are there any questions for Peter about that? I am not seeing any. Kevin.

MR. ANSON: Thank you. It may not be to Peter, but just a general comment or question, and I guess it is a question. One thing, after going through the calibration workshop and looking at the CHTS data, and to some degree the FES data, and so it might still play, it appears, for red snapper, the longer the season, the more stable, and I know, when we looked at the calibration, we looked at the most recent years, and more for stability, but we also had, I think, a little bit more days,

relative to what we did back in 2013, 2014, and 2015.

I am just wondering if in fact the calibration changes because we're afforded more fish, and therefore a longer season, and what would be the process for us to come and reevaluate this, in case this buffer in fact is too much, a couple of years from now? Do we come back and do the same thing and just do an amendment and change the buffer?

CHAIRMAN GUYAS: Great question.

DR. CRABTREE: I mean, I think that is what you would do, Kevin. You would have to go through the SSC and the reviews and all that, but, if you found evidence that the basic science had changed, then I think you would come in and make modifications accordingly.

18 MR. ANSON: Thank you.

CHAIRMAN GUYAS: Mara.

MS. MARA LEVY: Roy answered it. I think that's right. I mean, you would make changes as you see fit and as the science and your information indicates.

CHAIRMAN GUYAS: Thanks, Mara. Okay. Let's go back to Ryan and let you continue, and then hopefully we can wrap this up and take a break.

MR. RINDONE: I am wrapped, Mr. Chair. I don't have much else to follow with. There is a table that you guys haven't seen pop up on the screen yet, Table 2.2, and this shows the Gulf state-specific private angling component ACLs and ACTs, as adjusted, using that 23 percent buffer, and applied to the 2020 fishing season, and so you can see those data there. Based on the current calibration ratios, the total predicted assumes that each state catches its exact ACL, and so that's the only caveat, really, right there.

 Then there is some comparison information there as to how Alternative 2 and 3 match up, and, as you guys can undoubtedly surmise, depending on which alternative you choose, some states would see their ACL increased or decreased or unchanged, and that's it.

CHAIRMAN GUYAS: All right. I think, with that, then -- We've had a lot of good discussion on this, and we've really talked through a lot of the things that I think are going to be on our

minds. Kevin, is your hand still up?

MR. ANSON: No, it's not.

 CHAIRMAN GUYAS: Okay. Just making sure. All right. I think we can wrap this up then. Clearly, we're going to talk about it more at our next meeting, with a little more context with the information about the Great Red Snapper Count, and so I think, at this point, let's take that break that's on the schedule. Dr. Frazer, I don't know how long you want to break, given our adjusted schedule today, and I do see that Greg just put his hand up.

DR. FRAZER: I will wait to see what Greg has to say, and then we'll go from there.

CHAIRMAN GUYAS: Okay. Greg.

DR. STUNZ: Martha, I can make it pretty quick, since we're right ahead of a break, but something that I'm getting confused on, regarding all these buffers, and especially if we're talking about applying another 23 percent buffer, is, the next time we talk about this, at the next meeting, is it possible to have staff give us some guidance on what's the total buffer that the recreational sector is under right now, because, obviously, there's the other 20 percent buffer, right, and then we also have just the regular buffers that you get with ACL management, in terms of reductions from the overfishing limit down to ABCs and that sort of thing. I am trying to get a general handle on what that looks like, but I don't know. I tried to look it up, but I am having a little difficulty with that.

CHAIRMAN GUYAS: Noted, and I think it would be nice to have all that pulled together. Good point. Dr. Frazer.

 DR. FRAZER: Real quick, let's take a ten-minute break, and I just want to make a few quick comments. Martha, I think you were right on with regard to where we are. We've got a lot of things that are still in the hopper, and Greg needs to get that report out, and Clay needs to kind of integrate it into an interim assessment, and so we have some time to think about things, but we do not have the luxury of years to do this, and so we need to be kind of looking hard at what our alternative actions might be in this document coming up.

I think Clay made a really good point, and I just want to hammer that home, that we need to manage expectations, right, because a general perception that we have three-times as many fish is very 1 unlikely to equate to three-times more quota in any of the 2 sectors, for lots of reasons.

Again, we're unlikely to alter, in a large way, fishing behavior, and so people are still going to be fishing on the places where they have access to, high-relief bottoms, et cetera, et cetera, and, also, and I did talk to Clay about this before, but the fact that we have three-times as many fish means that we probably overestimated the productivity of that stock, and, if we fish longer, we're going to have more discards, and all of these things are going to play into how many fish we can catch, and so we're going to have to temper those expectations and probably meter things out.

Then, finally, I would say, with regard to the buffer situation, we can certainly have staff put together a presentation about the various scenarios moving forward, and so we'll plan for that. Let's take -- It's 10:45, and let's take a ten-minute break and come back at 10:55. Thanks.

(Whereupon, a brief recess was taken.)

DR. FRAZER: Martha, it looks like, before you get started, it looks like there might be a holdover with Mara having a question.

CHAIRMAN GUYAS: Mara, are you back on?

DR. FRAZER: We might have to wait just a couple of minutes, to make sure that we get a few more folks. I will let you start the discussion as you can see them.

CHAIRMAN GUYAS: It looks like we're getting there, and I would like to get Mara's hand before we get into red grouper, because I'm assuming it was about red snapper. Mara, are you on?

MS. LEVY: Yes, and you can take my hand down. We can address the buffer thing another time.

CHAIRMAN GUYAS: Okay. Thanks. All right. Let's move into our next agenda item then, which is Agenda Item V, Public Hearing Draft of Amendment 53. I think Dr. Freeman is going to take us through that, and can we start with the action guide for that, to remind us what we need to do today?

PUBLIC HEARING DRAFT AMENDMENT 53: RED GROUPER CATCH LIMITS AND SECTOR ALLOCATIONS

DR. MATT FREEMAN: Sure, and so we're on Public Hearing Draft Amendment 53, and staff will review the actions and alternatives in the public hearing draft. The committee should then discuss actions making modifications and consider the recommendations from the Reef Fish Advisory Panel, and then the committee may select preferred alternatives and direct staff to hold public hearings.

As a reminder, the purpose for this document is to revise the red grouper allocation between the commercial and recreational sectors using BSIA and to modify the total and sector ACLs based on the results of the recent stock assessment and subsequent OFL and ABC recommendations from the SSC.

The need is to use the best scientific information available to establish Gulf red grouper sector allocations and ACLs, ensuring that the historical participation by the recreational and commercial sectors is accurately reflected by the sector ACLs and that the recreational ACL is consistent with the data used to monitor recreational landings and trigger accountability measures.

Again, as a reminder, acknowledging that the status quo sector allocations for red grouper are based on the older, no-longer-used MRFSS data, the council requested that the SSC examine alternative sector allocation scenarios, considering the contemporary FES-calibrated MRIP data.

As a reminder, the SSC reviewed these scenarios and recommended the projections included in Alternatives 3 through 5 of Action 1 as scientifically-valid estimates of OFL and ABC. The OFL and ABC included in Alternative 2 of Action 1 had been previously recommended at the September 2019 SSC meeting.

As a reminder, and this is in the document, any allocation, or reallocation, must be consistent with the Reef Fish FMP objectives, and so I have included those on this slide and the next slide, just in case the council chooses to discuss that at the end of the presentation.

Dr. Diagne covered some of this yesterday, but, as a reminder, the councils were requested to establish allocation review triggers, and the council selected two, the time-based and public input. In terms of recreational and commercial allocations of red grouper, the review will occur every seven years, but, and this being an example, the council can initiate supplementary allocation reviews at any time.

As an overview, Action 1 will determine commercial and rec sector allocations based on the data used. In the case of Alternatives 1 and 2, that's with MRFSS. With Alternatives 3 through 5, that's MRIP-FES and using average landings across various time ranges.

6 7

8

9

10 11 Alternative 1 is the no action, which would maintain 76 percent commercial and 24 percent recreational and would maintain the current OFLs, ABCs, and ACLs. However, Alternative 1 is not legally viable, because it would not be based on the best scientific information available, and it would retain OFL and ABC above values produced by SEDAR 61.

12 13 14

15

16

Alternative 2 would maintain the current sector allocations of 76 percent commercial and 24 percent recreational. However, the OFL and ABC would be revised, as recommended by the SSC, and then the stock ACL would be equal to the stock ABC.

17 18 19

20

2122

23

Alternative 3 would revise the sector allocations, again using MRIP-FES, for the years 1986 through 2005, which would result in 59.3 percent commercial and 40.7 percent recreational. Similar to Alternative 2, the OFL and ABC would be revised as recommended by the SSC, and, again, the stock ACL would be set equal to the stock ABC.

242526

27

28 29 Alternative 4 would revise the sector allocations, in this case using landings from the years 1986 through 2009, resulting in 60.5 commercial and 39.5 percent recreational. Again, OFL and ABC would be revised, as recommended by the SSC, and, again, stock ACL would be set equal to stock ABC.

30 31 32

33

34

35

Alternative 5 would use the longest timeframe, in this case 1986 through 2018, resulting in allocations being 59.7 percent commercial and 40.3 percent recreational. Again, the OFL and the ABC would revised, as recommended by the SSC, and the stock ACL would be set equal to the stock ABC.

363738

39

40

41

42

43

44 45

46

This is an overview of the resulting OFLs, ABCs, total ACLs, commercial ACLs, and recreational ACLs that would result from these five alternatives, again keeping in mind that Alternative 1 is not a legally-viable option. The column right below shows the rec Alternative 1, again, ACL, the MRIP-FES equivalent, and then that's carried through for the total ACL, and that's there simply for the analysis in Chapter 4, so we would have basically an apples-to-apples currency. I will pause at this point, in case there is any questions, before going into Action 2.

**CHAIRMAN GUYAS:** All right. Are there any questions on Action 2 1? Dale.

MR. DIAZ: I just want to make sure that I'm 100 percent right on this. Alternative 3 is the alternative that has this set as close to where it could be, had we never implemented the new FES into the stock assessment, and is that correct?

DR. FREEMAN: Dale, sorry, but could you repeat that for me?

11 MR. DIAZ: I just wanted to clarify that Alternative 3 is the 12 alternative that sets us as close to what the allocation would 13 be had we never implemented FES into the new stock assessment, 14 and is that correct?

**DR. FREEMAN:** Alternative 3 does use the MRIP-FES landings, but 17 it uses the same time range as Alternative 1, the no action. 18 Does that answer your question?

MR. DIAZ: I think it does. That is basically the same parameters that were in place to come up with the percentages for Alternative 1 are the same parameters that are used for Alternative 3.

 DR. FREEMAN: Correct. Right. So it's using the same average landings from 1986 through 2005, and Alternative 1 was based off of MRFSS data, and Alternative 3 is based off the MRIP-FES landings.

CHAIRMAN GUYAS: Alternative 3 puts us in an apples-to-apples situation with the quota and the data collection system that is being used, I think while essentially also keeping what's caught, I guess, by each sector more or less the same. It looks like an allocation shift, because the numbers change, but I think, based on the switch to FES, what happens on the water doesn't change, I think, if that makes sense.

 MR. DIAZ: It does, and that's important for some of the comments, and I just read through the comments in the last couple of days, and so there is at least an alternative that keeps things very close to where they were, and so that's my only point. Thank you, Martha.

44 CHAIRMAN GUYAS: Sure. John Sanchez.

46 MR. JOHN SANCHEZ: I just have a question, and I don't know who 47 would be best to answer it, but, given the difference between 48 GRFS and FES, does anybody have an idea which one could be perceived as better?

CHAIRMAN GUYAS: I could answer that, but probably someone else needs to. I am guess Mara's hand, and Richard's, since they're going up, they will address that. Mara.

MS. LEVY: I just wanted to point out what Matt already pointed out, and it was in that table, and the reason that we have the MRIP-FES equivalency under Alternative 1 is so that you can make that apples-to-apples comparison, and so, looking at the status quo for the rec ACL, if you're looking at what it is now, it's one-million pounds. If you look at it in the MRIP-FES equivalency, it would be 2.1 million pounds.

Then you look at what the resulting ACLs would be under the alternatives, and so any one is going to be a potential decrease, some more than others, and it's the same for the total, right, and so the total, if you look at MRIP-FES -- There's going to be a decrease in all of the total ACLs, some more than others, again. Thanks.

**CHAIRMAN GUYAS:** Richard, did you have your hand up to address this?

DR. CODY: Yes, and I wanted to address the question, but, realistically, there's no good way to compare surveys. We do know that the supplemental surveys, such as the GRFS, were designed to do specific things, and some of those are different than what MRIP is designed to do.

In the end though, you have two different surveys, two different designs, and you have to have some way to compare those estimates. That's one of the jobs of this transition team working group, will be to look at drivers for differences between the surveys, so we can get a better understanding of why there are differences.

CHAIRMAN GUYAS: Thanks, Richard. Leann.

 MS. BOSARGE: Thanks, Madam Chair. I wanted to follow-up on what Dale's question was, and can we pull up page 23 of the document, because he asked about GRFS versus FES, and I asked, at the last council meeting, if we could have that put into the document, and so it's on paper page 23 of the actual amendment.

46 There is a -- between GRFS and MRIP, and Dr. Cody said that they 47 were designed to capture different things. Well, I think that 48 GRFS was trying to get at offshore species, and so, if it was designed with that intent, and its methodology has been approved, then it should be taken into account, and I think, unfortunately -- You know, we just had a conversation on red snapper, and it sounds like, when we get to the stock assessment on red snapper, we are going to at least entertain the idea of using some of this state data, see if we can piece it together and make it work.

With red grouper, and I'm not blaming anybody for this, but red grouper was the first species that we plugged FES data into a stock assessment for. In fact, it got delayed several times because we still didn't have historical landings in the FES currency, and we were trying to back-calculate all those landings, and the assessment team had to wait on that.

The council was never presented those landings streams before it got plugged into a stock assessment. Had we been presented those, and seen how drastically different they were for red grouper, versus GRFS, which GRFS has been in existence just as long as FES, and they are the same. If you want the age of those two children, it's the same.

Then we might have said, hey, you know, when you plug this into the assessment, it would be nice if you at least did a sensitivity analysis with this GRFS data and tried to look at these and see which one is probably closer to the mark, because I'm going to be very frustrated if, a couple of years from now, two years from now, when we start the operational assessment for red snapper, we use state data in that assessment and we end up going back into this red grouper and having to plug state data in and do this allocation twice.

We need to back up right now and look at these numbers and figure out what direction we're going to go. Red grouper, health-wise, is not in a good position, but that actually gives us a little bit of leeway, as far as what we do with this document, and we're not catching the quotas. Neither sector is catching its quota, and so we don't have this huge pressure on us to hurry up and increase these quotas and do -- No, and we've just got to make sure that we put in place an OFL and an ABC that was recommended.

We don't necessarily have to start reallocating real fast, because we might catch -- Here, they have finally got this page up, and look at GRFS. That's the first column. The second column is what I call the old MRIP, the MRIP-CHTS. All right, and so that's what we are all used to, and now the third column is this new MRIP-FES.

GRFS and old MRIP, in 2016, are 900,000 pounds, round about, and the new MRIP is 2.2 million pounds, and it's not a little This is huge differences. In 2017, you've got GRFS difference. and old MRIP at about 300,000 or 400,000 pounds, and you've got new FES-MRIP at 1.3 million pounds. They are big differences, and, if you look on the whole, if you go back and just look at the first two columns, GRFS and MRIP-CHTS, old MRIP -- We didn't -- There was a couple of things that we had going on that needed to be fixed, and we weren't sampling long enough into the day at

nobody uses anymore.

We figured -- Generally speaking, commonsense would tell you that you were probably missing some recreational landings and effort, and so probably recreational landings and effort should have been a little bit higher than what CHTS was estimating, and, if you look at GRFS, that's pretty much what you get, with the exception of the first year there, and it's a little bit higher than old MRIP, and that makes sense to me, in my simple world.

the boat ramps, and we were using the landline telephones that

 MRIP-FES is orders of magnitude different, and it's not a little more. I mean, it's -- I can't even do the math. It's 400,000 pounds going up to 1.3 million, and that's a lot of difference, and I think it's time to back up and take a hard look at this. I don't think you need to rush into an allocation shift until you get this right, until you send this information to your SSC and to the Science Center and say, hey, you go back, and let's look at these landings streams and figure out which one should have been plugged into that assessment, and let's figure out what we can do from there.

I don't know if you can do a sensitivity analysis, and I don't know if you've got enough information on your conversion formulas that you use for Florida for red snapper that you can simply use that conversion ratio and plug some stuff into this red grouper assessment, but we need to stop for just a minute and take a look at this.

 We've already got the cart before the horse in not presenting this to the council before we plugged it into an assessment, and that's the council's fault too, because we pushed on the Science Center to get it out, get it out, get it out, and we should have checked up. These are big changes, and we haven't gone through them and really discussed them.

We're starting to discuss them in red snapper, because you have

five states pushing back on you and saying, woah, woah, uh-uh. We're not going to just take this and you hand it to us and that's it. We need to talk about this.

Unfortunately, I mean, you've got a couple of commercial people on the council, and I guess we don't have enough clout for people to check-up and take a look at it when it affects us.

CHAIRMAN GUYAS: Thanks, Leann. Clay, I don't know -- Clay or Roy, if you want to address some of this, and so, I mean, I can say, when this assessment was done, it includes data through 2017, and the Gulf Reef Fish Survey didn't start until partway through 2015, and so I think, at the point the assessment was done, there were not enough data to run this in the Gulf Reef Fish Survey. At that point, we may not have even been certified, and certainly we didn't have calibrations at that point.

We do now, of course, but -- I hear what you're saying, Leann, and it is very frustrating, because we have this data collection system running in Florida that we think is more accurately capturing what's happening in the reef fish fishery, but it's certainly not, in this case, being used for management or assessments, but there, I believe, a number of steps that we need to go through for that to happen, and so, Roy, I see your hand up, if you want to -- Can you talk us through this a little bit? I think Clay's hand has gone up as well. Thanks. Roy.

 DR. CRABTREE: When you look at the numbers on the screen, Leann is right that GRFS is a little higher than MRIP. Well, we knew that, and we knew our calibration ratios -- That's consistent with what we saw with red snapper, and the FES numbers are double the old MRIP-CHTS, or maybe a little more in some cases, which that's what we've known for some time was coming out of this, and I don't understand the going back to the SSC.

 The SSC has already reviewed this and accepted it, and it's been through them, and they were aware that it was based on FES, but, I mean, the FES numbers are higher, and so, I mean, I'm not sure where we're going with this, and I guess I would like to hear what Clay has to say, and I'm gathering you are interested in re-looking at it with the GRFS numbers, and it seems to me that you could convert the outcomes of it into GRFS units, if you wanted to, or something, but maybe Clay could comment on that.

CHAIRMAN GUYAS: Clay.

DR. PORCH: Sure. Thank you, Chair. Two issues to think about

here, and, in the first case, when we did the red grouper assessment, the Chair is absolutely right that, at that point, we had no way to calibrate GRFS back in time, and so FES was really the only game in town, in terms of having numbers that went all the way back in time, because you have to have a consistent time series when you're doing a stock assessment.

You can't use one metric and then use another that is supposedly measuring the same thing, but has a lot lower value, because what it would look like is a big drop in the fishing mortality rate, when it's really, again, you just change the metric that you're using, and so it's more important to be consistent through time.

Having said that, since then, I know the State of Florida is working on trying to come up with calibrated measures back in time for the gag stock assessment, and so we will be looking at both an assessment with FES and with the calibrated GRFS estimates back in time, or at least that's the state of play as I understand it now.

Then we'll get different ABC estimates, one in the GRFS currency, for the most part, and one in the MRIP currency. Now, that may not actually make much difference, in terms of management, because you will get a higher ABC using FES than you will with GRFS, and it's just the way the assessment is going to come out, because you're saying you've got the same trends in abundance with higher catch with FES, and so that implies the stock must have been bigger and you can take more, and, when you use GRFS, it's going to have the opposite, and it's going to say the stock must have been smaller, and you will get a lower ABC.

All that probably will come out pretty close to a wash, once you make the conversion from FES to GRFS, and so, on the one hand, you do the assessment in GRFS, and you get a lower ABC, and, on the other, you do it with FES, and you get a higher ABC, but, if you're going to use GRFS for management purposes, then you will have to apply the calibration, and it will probably come down rather close to as if you did the assessment in GRFS to begin with.

I won't say that it will come down to the pound the same, but they will be in a similar ballpark, and so it's really just which is most defensible, a GRFS-calibrated time series back in time, which we haven't seen yet, and it hasn't been peer reviewed, or the FES version that was calibrated back in time, which has had some level of peer review and the SSC has discussed. I mean, that's what it comes down to.

Ultimately, I'm with everybody else here, and I would really love to see some independent way to gauge which of these surveys, and all the state surveys, are getting the numbers most closely, and we don't have that right now. It is a project that we at the Southeast Center and the Office of Science and Technology at NOAA and the states have been talking about, and we're trying to put together a plan for that, because, right now, the best we can do is start explaining why they're different, and we can't say which one is more correct in any objective way.

CHAIRMAN GUYAS: Thanks, Clay. I guess we're back to I think what Leann was trying to bring up. For us to be able to use Gulf Reef Fish Survey, certainly for this document, to determine how to set quotas and how to allocate that quota, essentially, my understanding is that we need -- We would basically need another red grouper assessment, and it's not just another run or anything like that, and you are nodding your head yes, I think, and so I just wanted to make that clear.

DR. PORCH: Yes.

 CHAIRMAN GUYAS: I think that's laid out in that white paper as well, and then, of course, it would need SSC review and all that, but I think that's a struggle for a lot of us here, but, based on our SEDAR schedule -- I think we have another assessment on the books, but it's a few years out, and so I think we are where we are, more or less, right now with this stock. Is that accurate, Clay?

DR. PORCH: Yes, that's accurate. The only way we could use GRFS now is with a calibration factor, and so the estimates come out in FES now, and the ABC, and so we would have to do calibrations, similar to what we're talking about with red snapper, except, of course, it's simpler, because it's mostly involving one state.

CHAIRMAN GUYAS: Right, and so I think we're working on those calibrations, or we have those in hand now, but they would have to be applied in a new assessment. Is that right?

**DR. PORCH:** If you wanted the ABC to come out in GRFS currency, 44 yes. We would have to run a new assessment. Otherwise, we have to convert the FES to GRFS from the previous assessment.

**CHAIRMAN GUYAS:** Okay. We've got lots more hands here. John 48 Sanchez.

MR. SANCHEZ: Thank you, Madam Chair. My concerns are this fishery, by all accounts, seems biologically compromised, and it's in question, and to reallocate right now -- I am not sure that I 100 percent embrace the discard mortality percentages that are thrown out with the recreational reallocation, and especially when you confound it given shark predation and all these things that we're experiencing on the water and people are complaining about at every public testimony.

I think we should hold off on the reallocation on this until we do feel more confident. We're certainly kind of taking a pumpthe-brakes approach with red snapper, and I think it's more warranted in this case, and then it begs the question of, if we were to reallocate, what happens to the commercial IFQ? Is it going to be held back, in terms of some kind of a reduction, anticipated reduction, and, if so, how would that be handled? I mean, all of these things, to me, support let's make sure we're doing the right thing here, and this fishery is not in great shape. Thank you.

CHAIRMAN GUYAS: All right. Thanks, John. J.D.

MR. J.D. DUGAS: Just a question, maybe for staff. Alternative 3, 4, and 5, how were the percentages determined? How did the 59.3 and the 40.7 -- How did those numbers come about?

DR. FREEMAN: Bernie, could you go to Action 1? Perfect. Those Actions 3, 4, and 5 are using -- I lost my screen. Sorry. Just one moment. I'm having technical difficulties.

Alternatives 3 through 5 are using the MRIP-FES average landings based off of different timeframes, and, Bernie, if you can scroll down, and there's a table of landings, and, at the very bottom of it, it shows these percentages. It's in that table, and, if you go all the way to the bottom, it shows, for the various alternatives, how those percentages are calculated. Does that answer your question, Mr. Dugas?

MR. DUGAS: Yes, sir. Thank you for clarifying.

**DR. FREEMAN:** Certainly.

44 CHAIRMAN GUYAS: All right. Next, I have Dale.

46 MR. DIAZ: I am just trying to think through where we should go 47 with this document and what we should do, and I do agree with 48 Leann. I mean, there's not an urgency with this species, and this is the first stock assessment we've had with FES, but, with a lot of other ones coming up that we're also going to be working on that have some allocation issues that are going to be using FES -- So, I mean, pretty soon, we're going to have make a decision on how we're going to handle this.

I know there's a lot of folks that have not been very comfortable with those numbers. However, I think the SSC did deem that it's best available science, and so I'm just trying to figure out where we need to go, and, if there's a path forward, I would like to make sure that council members are comfortable with we're doing too, and especially since we're not in a hurry to do anything, and I am just trying to figure out where we should be going to get where folks think we have the right, accurate numbers.

CHAIRMAN GUYAS: Roy, do you want to weigh-in on that?

DR. CRABTREE: Yes, and I get that folks have some discomfort with the numbers, because they are higher than we're used to, but that's the survey that is in place, and it's the only survey in place for a lot of the species that we manage, and so I don't see how we're going to not use the FES numbers for some of these.

Now, you might -- We're talking about reallocation, but -- I get how you see it that way, but, really, we're taking the same time period and just adjusting what the mix in the fishery was back then, and, now, it may be that we have -- Because we have conversions of these things, I think you could take the recreational ACL that's here and convert it into GRFS currency, and then you could monitor it using GRFS, and it may be that you could take some calibration or conversion factor and apply it back to the time series, in order to get the allocation, and what that would do would be to reduce the recreational landings back in time, and the allocation would come out something closer to what it has been.

Of course, the recreational ABC would come down by about half as much too, but I think any sort of conversion back in time is going to be relatively crude, and I'm not really sure that you're going to gain anything or pick anything up from that.

The reality is that we have a whole host of different surveys going on now, and people have opinions about which one is closest to the true estimate, but the fact is that nobody really knows which one, because we don't know what the true catch level is. We have estimates of it, and that's the difficulty we have,

but I'm not sure just saying we're not going to use FES -- I don't know how we're going to be able to do that.

The other part is the SSC has gone through this, and they have accepted this as the best available science, and it's not clear to me how we can decide that we're not going to use this.

CHAIRMAN GUYAS: I am going to go to a few more hands. Mara.

MS. LEVY: I mean, I just want to point out that, right now, we have an OFL and an ABC that are much higher than what the current assessment says, and the current ABC is much higher than the current recommendation from the SSC, and so, right now, we need to adjust those things to account for the best available science and the SSC recommendations.

CHAIRMAN GUYAS: Noted, Mara. John Sanchez, or, Roy, is your hand still up? I guess not. John.

MR. SANCHEZ: I agree with Mara, and I always thought that maybe these things should have been in separate documents. I understand the need to make the adjustments to OFL and ABC, and we should do that, but I don't think putting them together with the reallocation, which I think is being done in haste, in the same document maybe is justified.

CHAIRMAN GUYAS: All right. Thanks, John. Leann.

MS. BOSARGE: Thanks. John said exactly what I was going to say, but, yes, we need to take action on the OFL and ABC, but you don't necessarily have to rush to reallocate, in this particular instance. I like what I heard Clay say about the upcoming gag assessment, where they're actually going to use a historical time series of GRFS and a historical time series of MRIP-FES and plug both of those into the assessment and see what things look like.

 I would like to see us sit right where we're at on allocation and keep the allocation just like it is and take no action on allocation in red grouper until we get some outputs from that. That will tell me a lot about what the scientists think may be more plausible as a landings stream back in time, which one of those they choose to actually hand over in a final stock assessment, whether they use the GRFS historical landings back in time or they use FES historical landings back in time on gag. That will tell me a lot and keep us from doing this reallocation twice.

CHAIRMAN GUYAS: All right. Thanks, Leann. Mara.

 MS. LEVY: Just to point out that this idea of decoupling them They're linked, right, because the assessment uses the
allocation, and the outcomes, the OFLs and the ABCs, change
based on the allocation, and so I don't think you can de-couple
them, but I will note that Alternative 2 essentially keeps the
same allocation, but with the recognition that it's actually
going to change the allocation, and so we're keeping the same
percentages, but, because we're using a different recreational
landings dataset, it's actually shifting it, and we would have
to recognize that, but there is the alternative in there for you
to do that if you can come up with the rationale for how that is
fair and equitable and all those other things, but you can't
just have an action that addresses the catch levels, or the OFL
and ABC, without a distinct decision on allocation, because that
goes into the assessment and changes the results.

CHAIRMAN GUYAS: Thanks, Mara. I think, at this point, I will recognize -- I think Dr. Freeman had his hand up, and it might be helpful to move into Action 2, and particularly I know we've got the table that kind of breaks down I guess the implications of the various options. Matt took his hand down. Roy, is your hand back up?

DR. FREEMAN: Mara addressed what I was going to say, as far as Alternative 2 in Action 1, that that did provide sort of a status quo allocation between the commercial and recreational sectors, while going ahead and adjusting the OFL and ABC. That is an option within Action 1.

CHAIRMAN GUYAS: All right. Roy, is your hand up?

DR. CRABTREE: Yes, and so part of what I wanted to cover Mara addressed, and the allocation is linked to the ABC, and so they need to be in the same document. The word "reallocation" and what that means, we're not being clear about that.

 If you keep the percentages the way they are right now on the book, and then implement these new catch levels, and we start using FES to monitor it, that would be a large reallocation of the fishery to the commercial fishery. That is essentially a de facto reallocation, and so you've got to look at all of these things in context, but I don't see how you can put in place the catch levels that come out of this new assessment without making adjustments to the allocation, and it gives you some real problems with, well, what's the basis of the allocation right now.

1 2

It's supposed to be based on the mix in the fishery during a historical period, but that's not the mix in the fishery anymore, using these new numbers, and, if you want to stay with the rationale that we used to put the allocation in place, it then changes to one of these alternatives, and so I know allocation is touchy to everyone, but we just need to be careful with what we're calling reallocation and not reallocation.

CHAIRMAN GUYAS: Thanks, Roy. Leann.

MS. BOSARGE: Madam Chair, before we leave this action, because this one has the tables in it, and I want to stay in the document, in the action that we've been talking about, and not this buffer stuff, but the one we've been talking about with the OFLs and the ABCs and the allocations, and can you go to that table on page 16, staff? Paper page 16, and you know I'm old fashioned.

I sent something to staff earlier, and this is something that's been bothering me. If you all remember in Texas, at our Texas meeting last year, 2019, about this time, we were presented allocations from the Science Center that came out of the assessment, and they were drastically different than what we have in this document. I was closer to 69 percent for the commercial guys, instead of the 58 or 59 that we have in this document.

They presented that based on the landings stream that the assessment model estimated for recreational landings, and Roy, NMFS, came in and said, hey, you can't use that for your allocation, and you've got to use true landings, actual historical landings, and it has bothered me that those two numbers are so different from each other. I did some calculations, and scroll up a little, so you can see that table at the bottom, please, ma'am.

 This is from our document, and I put an extra column in here, and what I did was I took the recreational landings that the stock assessment model estimated as recreational landings, and I have written them out in that column in pen, in hand-written numbers, and look at the difference between what the model estimated for recreational landings, the stock assessment model, versus what the actual recreational landings in FES are.

The model does this for commercial too, and I did the commercial numbers and put them out there for you too, so you could see what the model estimated for commercial, and the problem, in my

mind, with this, and this is where I really want this to go back to the SSC and have some further discussion, but, on commercial, the model got it pretty close to what commercial landings are.

In some years, it estimated a little higher commercial landings, and some years it was a little lower, but it was on either side. In the recreational landings, with the exception of the first year, 1986, the model estimated every year lower than what actual FES landings were, and substantially lower, and so the estimates were directional and significant differences, and that, to me, seemed a little strange.

I already have my doubts about the FES numbers, when I look at GRFS, which are much lower, but then, when you get into a stock assessment, and your stock assessment model estimates, year after year after year, that recreational landings were actually lower than FES, I think it warrants a discussion at an SSC meeting, so that I can get some clarity on what exactly went into that, and we can have a brief discussion here at this council meeting, but I want a deep discussion on this, to understand it.

We had some issues with the previous red grouper assessment, and this red grouper assessment came out fairly rosy, compared to what we think the fishery, the stock, looks like, and we tempered it down with some qualitative factors, and I think we need to take a look at this.

CHAIRMAN GUYAS: All right. Thanks, Leann. Leann, are you comfortable with this being emailed out to council members, or posted, so that people can look more at this?

MS. BOSARGE: Yes, and there's actually a second page that continues on in time with those numbers that the stock assessment estimated too, but I just didn't have staff scroll down, and I quit doing the commercial ones. I just ran out of time.

CHAIRMAN GUYAS: All right. Thanks. John Sanchez.

41 MR. SANCHEZ: I'm sorry. My hand was still up, but I'm good.

CHAIRMAN GUYAS: Okay. Clay.

**DR. PORCH:** I just wanted to make the point of why the commercial landings are matched closer than the recreational, and that is, in the assessment, because of the way the data are collected for commercial, they are generally regarded as more

precise, whereas there is considerable uncertainty with the recreational estimates, and we actually -- I can't remember, for this assessment, if we're actually incorporating the PSEs directly or we just use an average value, but, basically, we tell the assessment model that the recreational estimates are less precisely known, and so it doesn't have to fit them as closely.

 I will have to look into it, but it may be that the trend that Leann is mentioning is for those particular years, and not in subsequent years, and so I will take a look at it, and, in fact, I have someone looking at it now, but it could just be the way the model is fitting that data, and it estimates lower values for recreational catches in the 1990s through 2005, and then it's higher in previous or subsequent years, but we'll have a look at that, but we did tell the model that recreational statistics are known as precisely as commercial.

CHAIRMAN GUYAS: Okay. Thank you. Leann.

MS. BOSARGE: Thanks. I would like to make a motion that we send this information to the SSC, to have them take a deeper look at it and explain. If I can get a second for that motion, I will give you my rationale on why.

MR. SANCHEZ: I will second that.

CHAIRMAN GUYAS: All right. We've got a second from John, and let's give staff a minute to get this up on the board. Leann, can you repeat your motion? I think that might help get it on the board.

MS. BOSARGE: Well, I had to say to provide them with my handout, but it's to refer -- Let's do this. To refer the SEDAR 61 red grouper stock assessment back to the SSC for them to provide further discussion and explanation on the differences between historical recreational landings time series and what the stock assessment model estimated as recreational landings. If Clay thinks that's clear enough, and I better let him chime in, to make sure I got it right.

 DR. PORCH: It's clear to me, and we can certainly chime in when it goes before the SSC and show them figures, but I will say that they have actually looked at that information. When they review the results of the stock assessment, we present the fits to the recreational and commercial data, along with other information, and so they have seen it.

MS. BOSARGE: Thank you, Dr. Porch, and this difference -- I will give my rationale now, Martha, if you're okay with that.

~---

CHAIRMAN GUYAS: Yes.

MS. BOSARGE: Roy has always told us, well, the quota will go up enough that, when you change the allocation, yes, it will be a shift in allocation, but you will still end up with same amount of fish to catch, commercially, right, and, when you look at this document, you see that's not the case.

Our quota is going down, and this may have something to do with it, and so I would like, for that reason, to look it, but, more so, just to understand what in that stock assessment model was driving it to believe that recreational landings were a million, two million, or some years three million, pounds lower than what we told it FES numbers were. It had other data that it was looking at that drove it to that conclusion, and I would like to have a deeper discussion on that, so that we understand better what we're looking at here.

CHAIRMAN GUYAS: All right. Thanks, Leann. I'm just going to read this motion into the record, and then we can go to Roy's hand. The motion is to refer the SEDAR 61 red grouper stock assessment back to the SSC so that the SSC can provide further discussion and explanation on the differences between historical recreational landings time series and what the stock assessment model has estimated as recreational landings. Roy.

DR. CRABTREE: Okay. A few things here. Leann quoted me as saying that, if you switch to the higher landings and change the allocation, it all comes out the same. Well, not quite. All things equal, that would be the case, but all things aren't equal, and it's not surprising that the commercial quota is going down. I suspect the recreational is too, because the stock is in poor shape, and so it's not just the only thing going on here.

The other thing, Leann, is you said that I said you couldn't use the estimated estimates out of the stock assessment, and I don't think I said you couldn't, but I think there are a lot of problems with doing it that way, because, one, every time you update the assessment, or do it over, it's going to re-estimate all of those, and so, every time you do anything with the assessment, you're going to have to go in and revisit the whole allocation, but the bigger problem is then you're using the estimated landings to set the allocation, but then that's not what you're using to monitor the fishery. You're using the

actual observed landings, and so then you've got this this disparity, and I don't really know what that would do, if you went down that path.

3 4 5

6

7

8

9

10 11

12

1

2

I don't know that this motion is going to get us much of anything, and I suspect that Clay and the center could probably tell you what there is to know about this, and, obviously, the assessment is seeing signals from other things that makes it think that the recreational landings were something different, but we know that there are pretty big coefficients of variation on the recreational landings, and so we shouldn't think of it as just this value, but it's in fact a distribution around the value.

13 14 15

16

17

18

19

20

21

This is kind of different from what we've seen in the past, because, normally, when the center does these things, they essentially fix that the recreational landings are known pretty certainly, and, in this case, they allowed the model to vary from that, which I think is an improvement, and more realistic, but I do think, if you try to base allocations on those estimated landings from the model, that has a whole host of complications, potentially, with it.

222324

CHAIRMAN GUYAS: Dr. Simmons.

35

EXECUTIVE DIRECTOR SIMMONS: Thank you, Madam Chair. Just a couple of questions. I believe that the table that Ms. Bosarge is referring to is based on SEDAR 12 landings and then the ACL monitoring dataset that was used to estimate the alternatives for percent allocation between the recreational and commercial sector, and so I guess I'm a little confused about going back to SEDAR 61, and we're also a little unclear about the numbers you had, Ms. Bosarge, for the recreational landings. Where did those come from? Was that from -- Because we pulled up the stock assessment, and those are in numbers and not in pounds of fish, and could you remind us of that again, please?

36 37 38

39

40

41

42

43

44

45

MS. BOSARGE: Sure, and so the column that I wrote in pencil --If you go back to the Science Center presentation from Skyler that was given to the SSC in their meeting where they blessed that stock assessment, that red grouper stock assessment, as the best scientific information available, one of the last slides that she had in there, and I don't know the slide number, gave those numbers in metric tons for both commercial recreational, and all I did was convert the metric tons to It's in one of her additional slides at the very end.

46 47 48

Your question -- Historical recreational landings, I think that

should be "observed landings". Clay, isn't that what you all call it in the stock assessment, where the numbers that -- We actually call it the landings stream that we use for allocations and stuff, that's on your ACL monitoring site, and those are observed landings, the ones that the stock assessment estimates?

DR. PORCH: Yes, but we mean it maybe a little differently than a lot of people would think of observed. I mean, we say it's observed with uncertainty, and, in other words, they're really estimates, right, and it's not that we actually counted every fish. They are just estimates, and so, when we say observations, we mean implicitly that they have some error associated with it, and that's why we don't match it exactly, but, yes, they are treated in the model as observations, in that sense.

I am looking at the graph from SEDAR 61, and that compares landings in fish, which is in numbers of fish, which is the way the model actually fits the data, and it does look like that the model estimates lower recreational landings, in number of fish, up until about 1994, and then, after that, after 1996, they're a little higher, and then there's a couple of years where they're a little lower again, and then, in the most recent years -- For some of the recent years, for like 2007 to 2012, they tend to be a little bit higher again, and so, in that sense, it's behaving pretty much as I would expect.

It's not that they're consistently lower in all years, but it's just little blocks of years, where sometimes the model predicts less, and other blocks of years where it tends to predict a little bit more, in terms of numbers, and I haven't pulled up what the statistics are in weight, but weight is a little tricky, because we don't have good weight information for the recreational landings in those early years.

It's better in the more recent years, but the length composition data was pretty sparse, and so that's why we don't actually try and fit recreational landings in weight, and we just do the numbers, and then the model would estimate, in addition, the weight of the recreational catch from what little information there is.

CHAIRMAN GUYAS: Okay. We've got a motion on the board. Are there any more questions or comments on the motion? Leann, is your hand still up?

MS. BOSARGE: No, ma'am, but, since you gave me the opportunity, I hope this will at least let the SSC look at it. I think

there's too many different indicators here of what may be different landings streams, and I want --I would personally, to have an explanation for those significant differences in what we say rec landings are and the estimates in that assessment model, which will create a very holistic picture to generate an estimate. I don't want to use the estimates for allocation, and that's not what I'm asking, but I just want an explanation.

 CHAIRMAN GUYAS: All right. Okay. I am not seeing any other hands, and let's go ahead and make a decision on this motion. Is there any opposition to this motion? Hearing none, the motion carries.

Okay. Now I think, if we could, let's go, I guess, back to Dr. Freeman's presentation and pick up with Action 2, and I think that's going to take us to lunch, more or less. Dr. Freeman.

DR. FREEMAN: Sure. Not to spend a lot more discussion on Action 1, but, if it's okay with Madam Chair, I think it might be beneficial to have Mr. Rindone discuss what the Reef Fish AP -- What their motion was for Action 1, or, if you would prefer, I can wait until the end to have him do that.

CHAIRMAN GUYAS: Yes, let's do that. I think that will be cleaner for us.

DR. FREEMAN: Okay. Mr. Rindone, if you're ready.

 MR. RINDONE: I'm always ready. The AP met on I believe it was October 6, via webinar, and they talked about a great many things, and this Amendment 53 being one of them, and, within the AP, there was little confidence in MRIP-FES as the best scientific information available, and the AP offered, during this discussion, several reasons as to why it thought that.

I believe Captain Walker may be on, and he can expound upon that, if he's available, but, ultimately, the AP decided to offer a resolution, and not exactly a motion, but just a resolution to the council to assist it in its decision-making process with respect to Action 1.

This resolution reads: Whereas, we, the Reef Fish AP, have thoroughly considered all options in Action 1 of Reef Fish Amendment 53 presented to us, and whereas we have been unable to reach a consensus, due to a lack of confidence in the recreational data used to inform the proposed allocations in the alternatives; therefore, be it resolved that the Reef Fish AP

cannot recommend any of the proposed alternatives in Action 1. This resolution passed unanimously. Madam Chair.

CHAIRMAN GUYAS: Thanks, Ryan. All right. I don't know that that -- I see Captain Walker's hand is up. Go ahead. Ed, you might be on mute.

DR. FREEMAN: Madam Chair, they're trying to get in touch with Mr. Walker right now. Give us just a minute, and they're trying to send him the conference code, to make sure he can speak.

CHAIRMAN GUYAS: Sure thing.

DR. FREEMAN: Madam Chair, if it's okay with you, we'll go ahead and proceed into Action 2, and if, at the end of the presentation, Mr. Walker is available, we can return to his comments then.

CHAIRMAN GUYAS: Okay. That sounds great.

DR. FREEMAN: Okay. Moving ahead to Action 2, Action 2 determines ACTs, and that is based on two items, one the commercial and recreational buffers, which are addressed here in these three alternatives, as well as the allocations selected in Action 1.

Alternative 1 is no action, and it would maintain the current buffers between ACL and ACT for each sector, with the commercial buffer being 5 percent and the recreational buffer being 8 percent.

Alternative 2 would apply the ACL/ACT control rule to revise these buffers, leading to a commercial buffer of zero percent and a recreational buffer of 9 percent. Alternative 3 was requested by the council to mediate the impact that a zero percent commercial buffer would have on the multiuse quota, which was what would occur in Alternative 2, and so that would maintain the current buffer between the ACL and the ACT for the commercial sector of 5 percent and then apply the ACL/ACT control rule to revise the buffer for the recreational sector, leading to a 9 percent buffer.

This shows the recreational ACTs based on selections from Action 1 and Action 2, and these are in millions of pounds gutted weight, and also in MRIP-FES currency, with the exception of Alternative 1 for Action 1, when paired with Alternative 1 from Action 2, which I have got double asterisks. Action 1, Alternative 1 isn't carried through for Alternatives 2 and 3 for

Action 2, again, because it's not a legally-viable option. We have it there, again, simply for comparison and analysis in Chapter 4 of the document.

If we go to the next slide, this was presented to the council by Mr. Pulver. These are the projected closure dates, and these are future landings that were determined from taking a three-year average of the three most recent years of complete MRIP-FES data, and, again, these are predicted, and they can certainly vary depending on changes in effort during the season, and, these being closure dates, I do want to note that, in terms of the accountability measure for the recreational sector -- One second.

This paragraph right there, I did want to note that -- This is 2010, and the recreational ACL had been exceeded in 2013, and there were in-season closures in 2014 and 2015, as a result, and so some of the in-season closures may not actually occur within the season, should the quota be exceeded, if that makes sense, for those predicted closure dates. I guess one way to look at it is that's when it's predicted that the quota would be met.

This is just a projection, and so the next steps are obviously contingent upon council motions, and, depending on what's decided by the committee and Full Council, some of the next steps would be that SERO would send a notice of availability to be published with EPA, and then council staff would schedule and hold public hearing meetings, although it sounds like some additional discussion may occur by the council before these steps would happen, and I just wanted to lay that out for the committee to see. I will stop there, and then do we have Mr. Walker available? Okay. It looks like he's available, and so I will let him go ahead and speak to the committee.

MR. ED WALKER: To answer the question originally, the AP kind of kicked it around, I think just to try and make some progress for you guys, and we pulled out a couple of the alternatives and essentially forced everybody to give an opinion on it, because not many people wanted to put their name on this, because the universal opinion in the room was skepticism towards the FES, such monumental changes in the fishery based on something that a lot of the AP members just seemed to think they had questions about, and they're not real confident in it.

In trying to put forth a motion that would make such big changes in the fishery, like essentially life-altering changes for some people in red grouper land, nobody really wanted to touch it, and so we pulled out a couple anyway, and we kicked them around the room, and we voted down essentially, I think, three of the alternatives that we tried, and I believe there were five at the time, and the first one technically isn't legal, and so there were four.

We tried several of the others, and all of them were voted down, and we could not -- I could barely get anybody to talk about this issue, and it's almost like what I'm seeing going on in this meeting right now, and it makes a lot of people nervous, making such big decisions on completely new data, historical data, and so that's the way the AP went, and we were essentially deadlocked on nothing, and, rather than hand you guys nothing, one of the panel members drafted that -- It's not a motion, but just a resolution that we handed you, and I think that's the best we can offer, and we just leave it in your hands. I'm happy to answer any questions that anybody has about that.

CHAIRMAN GUYAS: All right. Thanks, Captain Walker. Are there any questions about the resolution? I will give people a minute here. If not, Ed, was there anything -- Do you all have a motion or anything about Action 2? I can't remember.

MR. WALKER: Which was Action 2?

**DR. FREEMAN:** Mr. Walker, that was the one on the buffers, and 26 the AP did not make a motion.

28 CHAIRMAN GUYAS: Okay. So no motion there.

30 MR. WALKER: No motion there, no. That was just along the same lines, and this, again, goes to confidence in the data.

**CHAIRMAN GUYAS:** Okay. Thank you for calling in and being on 34 the line with us.

36 MR. WALKER: I will be here from now on, if there are any more questions.

39 CHAIRMAN GUYAS: Okay. I appreciate that. Okay. Dale, I see 40 your hand just went up.

42 MR. DIAZ: I just wanted to thank Mr. Walker for being willing 43 to serve on that AP and to chair it. I know it's hard to run an 44 AP when something like this comes about, and I appreciate his 45 service. Thank you, Mr. Walker.

47 MR. WALKER: You're welcome, and you're right that it was difficult to get anybody to speak up on that one, and, being a

virtual meeting, it makes it even a little trickier, but thanks. I'm glad to help.

 CHAIRMAN GUYAS: Okay. We are about at our lunchtime, and I don't see any more hands right now. We have managed to pass one motion relative to this document, but the staff was looking for some, I guess, direction here on a preferred, and the committee has not offered those at this point, and I suppose we can revisit those at Full Council, if we have a chance, and then, at that time, if we move forward with any sort of preferreds, we might also want to talk about scheduling and holding public hearings meetings. Roy, I see your hand is up.

DR. CRABTREE: Just one thing to think about, and so red grouper is a stock that everyone agrees is not in good shape, and, if we don't select a preferred, or get somewhere on this, I don't think the Fisheries Service will be able to hold back any quota on the commercial side, which means it's going to be very difficult for you to make any changes to the quotas until the 2022 season, and so we've got quotas that are likely too high, and an assessment that's getting out of date, and we're going to wait until 2022, it appears to me before we're able to make any changes.

 CHAIRMAN GUYAS: Thanks for raising that. Okay. We've got some things, I guess, to think about between now and Full Council, when we go through this report. With that, I'm going to pass it back to the Chair.

DR. FRAZER: Thank you, Martha. We will take our scheduled break, and we'll come back at one o'clock.

(Whereupon, the meeting recessed for lunch on October 27, 2020.)

\_ \_ \_

October 27, 2020

TUESDAY AFTERNOON SESSION

41 - - -

 The Reef Fish Management Committee of the Gulf of Mexico Fishery Management Council reconvened via webinar on Tuesday afternoon, October 27, 2020, and was called to order by Chairman Martha Guyas.

DR. FRAZER: Thanks, everybody, for taking a few minutes off

your lunch, and we're going to try to move through this in a way that's going to be most efficient.

Again, we had a little look at where we think the hurricane is going to go, as I'm sure everybody else did, and we have a landfall tomorrow in the late afternoon or early evening, and so we don't intend to spend all day tomorrow at all. In fact, if we can get rid of our business, or take care of our business, this afternoon, and perhaps come back with any remaining committee reports first thing in the morning, that's where I would like to go.

In the interest of time in the Reef Fish Committee, I think, Martha, if we can move to the gray triggerfish interim analysis, and that would be Agenda Item Number VII, and we can forego lane snapper, and we can actually also forego 36B, and I can talk about the rationale for that later if we need to, but that would then allow us to move into the Mackerel Committee and then in Full Council, where we could take care of some of the existing committee reports, and that would allow us some time to prepare the Reef Fish Committee report and the Mackerel report and get that taken care of first thing in the morning, and so, with that said, Martha, if you want to pick it up with gray triggerfish, that would be great.

**CHAIRMAN GUYAS:** Yes, we can certainly do that. While staff is pulling up the document, can we go through the action guide? Thank you. I am not sure if this is Ryan or --

## GRAY TRIGGERFISH INTERIM ANALYSIS

All right, and so Dr. Powers is MR. RINDONE: Yes, it's me. going to go over the interim analysis completed by the Southeast Fisheries Science Center for gray triggerfish, which used the SEAMAP combined video index, which is a combination of the Panama City and Pascagoula Lab video surveys and the FWRI video representative fishery-independent as its index abundance, and you guys should consider the catch modification recommended by the SSC and the recommendations from the Reef Fish AP and provide staff direction on next steps. Madam Chair.

CHAIRMAN GUYAS: Excellent. Thanks, Ryan. All right, and so let's go ahead and pull up Dr. Powers' presentation, and, Dr. Powers, we're ready when you are.

DR. JOE POWERS: Thank you. Recall that, yesterday, you had the discussion about what an interim analysis was, and this is a key

example of this.

If we go to the first slide, generally, an interim analysis, as explained before, uses a representative index of abundance, preferably fishery-independent, and you use that to adjust the ABC up or down, based on what the perception of the stock is, and, in the case of triggerfish, this was applied because the analytical assessment was rather old, and it's been some years since it was done, and it was SEDAR 43, done in 2015, and so it only included data through 2012. At the time, it was classified as not overfished, but experiencing overfishing, and it was undergoing rebuilding.

Just as a little background, the sector allocation is 79 percent recreational and 21 percent commercial. The council has maintained the ABC at 305,300 pounds whole weight since that time period, and there will be a table that shows that later, and then the recreational sector's allocation, in terms of the ACL, is 241,000, and the ACT is 217,000.

The basic premise of the interim analysis is you develop an index of abundance that tracks gray triggerfish over time and then establishes a reference period, and that reference period is an index which relates to a particular sustainable level of catch, and then you compare the index to the reference years, and this is called an I ratio, and then you adjust the catches by that ratio, and so, if the ratio is greater than one, then the catches go up. If it's less than one, then they go down a little bit

How much you go down is buffered by the uncertainty, and this is actually analyzed through more complicated sorts of analysis, management strategy evaluations, MSEs, and so you get a good idea of what level of buffer is needed in order to incorporate that, and this is essentially what was applied for gray triggerfish.

In the interim analysis, the survey that was used for this index was the video survey from the Pascagoula Lab and the Panama City Lab and FWRI in Florida. The fishery-independent index covers the sizes of gray triggerfish selected by the fisheries. It was generally agreed, from the assessment and subsequent analysis, that the stock hit its low point, in terms of spawning stock biomass, in the late 2000s, and spawning stock biomass has been since then, especially in the eastern increasing Therefore, the perception is that you can increase the amount of of catch, without removals, the amount jeopardizing the rebuilding plan for the stock.

 This was what the ABCs and the OFLs have been over the time period, and the adjusted current ABC remains at 305,000 pounds. The index, combined index, this is what it looks like over the preceding years, and the low point that was established as the reference point is 2009.

If you go to the next slide, what you see there is the red dot is the reference point, the 2009, and the recent average is the horizontal red line on the right, and, basically, if you compare the two of them, that becomes an I ratio of about 1.5, and, if you reference that to the 305,000, and adjust that by 1.5, the answer is 456,900 pounds whole weight, and so, in essence, what you're saying is, with this interim analysis, is that, based upon the index, the conclusion is that you can adjust the catches up by 1.5 and adjust things accordingly based on that, and so that was the basis of the interim analysis.

It is fairly simple, but there's a lot of evaluation that goes on, in terms of trying to establish the level of uncertainty for which this will work and the probabilities of getting erroneous sorts of answers.

This, again, puts it into the same context, in terms of the I ratio of 305,000 pounds and the adjustment and so on and how that gets allocated between the commercial and recreational.

The SSC was interested in the process, and there is concern that it is a limited sort of situation, and, in this particular case, the analytical assessment was done quite some time ago, and so you are adjusting it, and, in some sense, this is like a datapoor stock. You're making these sorts of adjustments, and the SSC agreed with the approach, and they felt that it was useful, in terms of adjusting the ABC accordingly.

 With that notion, the SSC approved the motion that is listed there, which basically says that the SSC recommends that the ABC be increased to the 456,900 pounds whole weight, based on the MRIP-CHTS, but we hedged our bets a little by saying that let's only do this for 2021 to 2023, and, if we're still in the same situation in 2024, then you're going to have to do another interim analysis, and so, obviously, a more comprehensive analysis would be preferred, but, at a minimum, what this motion is saying is that, in 2024, revisit it with an interim analysis. That was the basis of our results, and I believe that's the last slide. That concludes my presentation.

CHAIRMAN GUYAS: All right. Thank you, Dr. Powers. Are there

any questions? Kevin.

MR. ANSON: Thank you, Madam Chair. Thank you, Dr. Powers, for the presentation. Unfortunately, there was some feedback on the phone when you talked about the buffer for uncertainty, and could you go back over that and describe the uncertainty, as it relates to the interim analysis?

DR. POWERS: Well, I was speaking generically about interim analyses, and, basically, when the ratio goes up, then you would increase the ABC, and, if it goes down, you would decrease the ABC. How much you increase and how little you decrease it is governed by a parameter in the particular model, and so it isn't a one-to-one that it goes up completely, and so there is quite a bit of analysis that's being done about management strategy evaluation, and, in fact, the data-poor workshop looked at a number of these sorts of methods.

What we're basically saying is that level of uncertainty has to be incorporated into how much you go up and how much you go down. In this particular case, I think the index was used pretty much straightforwardly, and so that is a limitation. The analyst also mentioned that, if they were continuing to look, in general, about interim analysis, how big those buffers ought to be.

MR. ANSON: Thank you. I was just curious, because I don't know if this is the metric that you used or not for uncertainty, but, if that's the confidence interval that's around the estimate, that dashed line on the graph, it seems like they've gotten much tighter here in recent years, and so thank you for the clarification.

CHAIRMAN GUYAS: All right. Next, I have Susan Boggs.

MS. BOGGS: Thank you, Madam Chair. Dr. Powers, you mentioned, at the very end of your presentation, an interim analysis in 2024, but gray triggerfish is on a research track for 2023 to 2024, and so, when they complete the research track, are you suggesting that they immediately do another interim analysis?

DR. POWERS: No, and, basically, this is a -- The motion set some limits. At the time, we weren't sure whether in fact there would be a research track on this, and so all that we're saying is we're only making recommendations about this ABC for 2021, 2022, and 2023, and, come 2024, if you don't have anything better, the least you need to do is an interim analysis.

 CHAIRMAN GUYAS: All right. Thanks, Dr. Powers. Leann.

MS. BOSARGE: Thank you. Dr. Powers, we received a generic presentation on how this would work, I don't know, several meetings ago, and I didn't pull the presentation back up, but I thought I remember there being some sort of beta character, or function, in this whole process, and that beta -- In layman's terms, what I remember is it would dictate how closely you follow the index, how closely you want your advice to follow that index, both ups and downs, and I didn't get a chance to read everything that was on the briefing book on this, but did you all decide to go a different route, where you don't have to try and determine what that beta should be, but rather you just take more like an average of the more recent years of that index and go with that, create the ratio from that?

DR. POWERS: First off, the reference to beta sometimes is called a smoothing parameter, and it's also what I was referring to in terms of how much uncertainty you deal with it, and, in this particular case, the center's analyst tried to evaluate that, but, given the circumstances of this particular -- And the fact that we have an analytical assessment that's out of date, they chose to sort of downplay that data factor, and it was evaluated, but, in terms of the final recommendation, it was more or less downweighted.

CHAIRMAN GUYAS: A follow-up, Leann?

MS. BOSARGE: No, ma'am. I'm good. That was all.

CHAIRMAN GUYAS: Okay. All right. Dr. Mickle.

DR. MICKLE: Thank you, Madam Chair. I have two questions, and the first one is for Joe. I appreciate the presentation, and I was not able to listen in on this meeting, and I really just would ask if the recruitment uncertainty was discussed in SEDAR 43, or was it brought up at all? I know this is an interim, and we're just kind of running through the existing models with new data, but was there any discussion there on the recruitment uncertainties that have been discussed in the past, at this SSC meeting, when talking about this specific agenda item?

DR. POWERS: My recollection of it was no, that there wasn't a lot of emphasis, and I think it was mentioned, and, for those of us that have been around for a while, we recognized that that was an issue before, but I think the focus, using this particular interim analysis, was to be able to have some structure that basically used the existing analysis, but

recognizing the general perception that things are getting better and to be able to have a scientific basis to adjust the quota, and that's essentially what the interim analysis is doing. Thank you.

DR. MICKLE: Martha, is it okay if I ask my second one?

CHAIRMAN GUYAS: Sure.

DR. MICKLE: Thank you. My next one is I think for Shannon Calay, and I think Clay is on another call, I saw in the chat box, and this is along the same subject matter, but approaches the recruitment uncertainties in the previous SEDAR 43, and I think there is a good effort on NMFS to fund some research to look at some sargassum and relationships with spatial coverage of looking at if there is some corollary metrics to look at there, and I think there was a grant that Frank Hernandez was a part of, and I think -- I'm not 100 percent sure, but I think they were presented -- The results of that study were presented at the Gulf States Marine Fisheries Committee meeting in the spring of 2019, and I may be mistaken, but I know the next stock assessment on gray triggerfish is intended to be a research track. Are any of these data potentially going to be incorporated into that research track, and I guess my question is directed towards the Science Center.

CHAIRMAN GUYAS: Dr. Calay, are you on the line?

MR. RINDONE: I might be able to help here.

CHAIRMAN GUYAS: Okay. Sure.

MR. RINDONE: Given that the gray triggerfish research track is now planned for I think 2024, with some of the schedule adjustments that have happened recently, what's going to be included in that assessment, to date, hasn't even been determined yet, and so, since it's a research track though, anything and everything that's available can certainly be considered, and so there's not a limitation, as of yet.

CHAIRMAN GUYAS: Okay. Thanks. I see now that Dr. Calay is unmuted. Is there anything that you want to add to that? Okay. We'll circle back around to her in a minute, and we also have Susan's hand up.

MS. BOGGS: Thank you, Madam Chair. I have a question, and, Tom, I'm sorry. We just got through talking about red grouper and FES, and we're looking at red snapper in FES, but you're

saying here that you're not calibrating to FES for triggerfish, and so it concerns me that we're using different numbers to move forward with any species of fish, and why aren't we being consistent? Thank you.

CHAIRMAN GUYAS: Ryan, do you want to address that?

 MR. RINDONE: Sure. You guys might remember that we had the SEDAR 62 assessment that was underway that was also looking at gray triggerfish, and that assessment had to be aborted, due to some issues that arose with the data, and they were not able to be reconciled in the time that we had to work on the assessment.

Because of that -- That assessment was the one that was going to move gray triggerfish from the Coastal Household Telephone Survey to the Fishing Effort Survey, and, because that assessment was stopped, that left us back with catch limits that are still in the data currency of the Coastal Household Telephone Survey, and so the interim analysis that we're talking about now used the same data currency, because we weren't using this interim analysis to change the OFL.

 This is designed to examine the ABC, when compared to the representative index of abundance, and so that's why we're still in that data currency for this species. When we do complete the research track assessment in the future for gray triggerfish, it will then be followed by an operational assessment, and, at that time, catch advice will be presented to the SSC, and the SSC's recommendations will likely be considerate of the MRIP-FES data currency.

CHAIRMAN GUYAS: Susan, does that answer your question?

MS. BOGGS: Yes, and it just concerns me that we're going to have all these different -- We're making decisions in different -- I don't know what you want to call it, currency or numbers or whatever, but it does answer it, and I do recall all of that. Thank you, Ryan, and that answers the question.

CHAIRMAN GUYAS: Okay. Dr. Powers, is your hand up?

42 DR. POWERS: No, it isn't. Thank you.

44 CHAIRMAN GUYAS: Okay. Leann, is your hand up?

46 MS. BOSARGE: Yes, ma'am. I was just going to say that, as we 47 get closer to the gray triggerfish assessment, that, if GRFS collects gray trigger data, which, Martha, you could answer

that, then I would hope that GRFS would be analyzed, because I'm sure -- I am guessing that there's a lot of gray trigger private rec landings that are in Florida, and I would hope that that data stream would at least be analyzed, the same way we're going to do it for gag, to try to figure out the best path forward for inputting data into the stock assessment.

CHAIRMAN GUYAS: Yes, it sure does, and that would be my hope as well, when we get to that point. I agree with you there. Okay. I am looking to see if there's any more hands here, and I am not seeing any right now, but we do have a new ABC recommendation from our SSC in this interim stock assessment in front of us, and so what would the committee like to do with this information? It might be appropriate to -- I think we could start a framework. Dale.

 MR. DIAZ: That's what I was going to ask you or Dr. Simmons. I mean, is it appropriate at this point to direct staff to start a document to be able to utilize this new information in the interim analysis?

**CHAIRMAN GUYAS:** I think so, but I will let Ryan or Carrie weigh-in here.

 MR. RINDONE: We have the vermilion snapper framework action that is underway right now that is also looking at an increase in that species' catch limits, and this would be appropriate to fold into that action, since it's essentially doing the same thing for another species, and we're prepared to do that for you guys.

Also, I wanted to mention that we do have a recommendation from the Reef Fish AP on this topic that you might consider as a function of whatever motion you would be fixing to make to this effect, and so, if you want to hear that, I can provide that.

CHAIRMAN GUYAS: Sure. Let's hear it.

MR. RINDONE: All right. The Reef Fish AP, meeting via webinar, talked about the interim analysis, and they were pleased to see that gray triggerfish was improving and thought it appropriate to follow the management approach currently in use by the council, which sets the total ACL equal to the ABC.

The AP recommended continuing to use the sector ACTs in the same manner in which they are currently used, and so they passed the following motion to go with the SSC recommendation and set the ACL equal to the ABC, at 456,900 pounds whole weight, and that

motion carried unanimously.

1 2 3

CHAIRMAN GUYAS: Thanks, Ryan.

4 5

MR. RINDONE: I believe Captain Walker is still milling about back there somewhere.

6 7

CHAIRMAN GUYAS: Okay. Carrie, it looks like your hand is up.

8 9 10

**EXECUTIVE DIRECTOR SIMMONS:** Thank you, Madam Chair. Ryan covered what I was going to go over. Thank you.

11 12

13 CHAIRMAN GUYAS: Okay. Leann.

14 15

16

17

18 19

20 21

22

23

24

MS. BOSARGE: As far as the type of document that we put it in, our discussions about thought that, in these assessments that we talked about yesterday, or earlier today, that we would try and get a framework, or an abbreviated framework, document that we could almost use as a template, so that, when we implement these interim catch recommendations, and that would make it a little easier going forward, if we had that template, where we could somewhat plug and play, but, if you roll it into the vermilion document, which I don't care which way you want to do it, it just didn't seem like you would end up with your template, doing it that way.

252627

28

29

CHAIRMAN GUYAS: All right. One thing I guess we could do is, if we wanted to get something started here, make a motion to do that, and then we could give staff some discretion to either add it to the vermilion document or start up that template.

303132

MR. RINDONE: I think Dr. Simmons wants to weigh-in here.

33 34

CHAIRMAN GUYAS: Please do.

35 36

37

38

39

40 41

42

EXECUTIVE DIRECTOR SIMMONS: Thanks, Madam Chair. I think the suggestion that we were trying to bring up in the presentation yesterday is just to look at this possibly in the Reef Fish FMP, in changing our framework there, and perhaps even in the Coastal Migratory Pelagics Framework, and I think that could take some time, and we're going to need to work that out and see the best way forward with that, and so staff was thinking that would be like a separate action.

43 44

For this triggerfish increase, I think staff was thinking the council may want to move fairly quickly on this, and so we would perhaps put it in with the vermilion snapper framework action, and try to simplify it, as soon as possible. **CHAIRMAN GUYAS:** I would agree with that. That seems a lot more straightforward. Leann, is your hand still up?

MS. BOSARGE: No, ma'am. I'm just for whatever gets it done faster, and I know we're going to need to implement this quickly, and I don't remember what's in that vermilion document that we might end up tripping over and it taking longer, but I will go with whatever staff thinks.

CHAIRMAN GUYAS: Okay. Kevin.

MR. ANSON: Yes, and that addressed my comment, or concern, with folding in the gray triggerfish increase in with vermilion, is the timing of it is -- There's a little bit of a need, I guess, with gray triggerfish and the timing of the season for next year, and I wouldn't want it to be slowed down, necessarily, if you were to include it with vermilion, but, if it's going at the same pace, or if it can be combined and it wouldn't slow that down, that would be fine with me.

CHAIRMAN GUYAS: Okay. I think everybody's take-home is we want a document, and we want it fast, however that comes. If vermilion is the way, then that's fine, but it would be helpful, I think, to get a motion on the board to that effect, if someone is willing to go there.

MR. DIAZ: I just sent a motion into Meetings, if they want to pull it up.

CHAIRMAN GUYAS: Excellent.

MR. DIAZ: If I can, Martha, I was just trying to put something together that was in line with what we were just talking about, and, definitely, if anybody wants to alter that language, or make some recommendations to change it, I would be amenable to that.

CHAIRMAN GUYAS: I am going to read this out loud, and then we'll see if we can get a second and if there's any discussion. The motion is to direct staff to combine gray triggerfish with the vermilion snapper framework action for the purpose of adjusting catch levels and utilize the information from the interim analysis. Is there a second to this motion?

DR. SHIPP: I will second it.

48 CHAIRMAN GUYAS: All right. It's seconded by Dr. Shipp. Any

discussion? I think this is more or less where we're wanting to go. I am not seeing any hands. Is there any opposition to this motion?

MS. BOGGS: I oppose.

CHAIRMAN GUYAS: All right. I've got one opposed. Otherwise, the motion passes. Okay. We're through gray triggerfish, and I think was all of the regular agenda items for Reef Fish that we were going to cover, based on our adjusted hurricane schedule. The only other thing we have is we do have an item of Other Business that Kevin brought up yesterday regarding dead discards of red snapper, and I assume we can kind of cover that pretty quickly, Kevin?

MR. ANSON: I think so.

CHAIRMAN GUYAS: Okay. Let's go ahead and do that, and then we can move to the Mackerel Committee. Go ahead.

## OTHER BUSINESS

 MR. ANSON: I think I mentioned this at the last meeting, but, through the participation in the calibration workshop, and it realized that there might be an issue relative to dead discards in the recreational fishery, as it pertains to monitoring the landings, and so I guess that's what I would like to hear some more information from the Science Center, is a description of landings and catch and how dead discards move through the assessment process and then back out to catch advice and how the Regional Office then interprets what is to be recorded, as far as monitoring landings.

can understand where dead discards are needed for assessment, and that those are calculated and run through the assessment when each assessment is done, but I guess I just need a little bit of understanding as to what the definition of "landings" are then, for the purpose of monitoring landings during the season, because it's my understanding, right now, that the recreational fishery -- The Service adds all of those dead discards where the anglers respond that they threw back the red snapper dead, although it was discarded at-sea, and those get added up and tracked against the quota, but I don't think there's a similar question, or similar data, that's collected for the commercial fishery, where they report their dead discards then those get imputed, or a poundage gets and associated with those dead discards and tracked against their ACL.

That's what I am trying to -- I would just like, maybe at the next meeting, just for someone from the Science Center to define that and describe it a little bit better, and, again, I looked at the accumulative landings system, the ALS system, and the language there describes the data that is used in the assessment, and they refer to catch for recreational landings, and then, later in the summary paragraph of the data, they describe landings for recreational data, and so that's all. I just wanted to see where that stands.

Then, if in fact there is some discrepancies, or some differences, as to how that's tracked in-season, relative to the recreational and commercial sectors, maybe they can add some rationale as to why one sector has the dead discards tracked inseason, to monitor against quotas, and then in the other they don't, and it might be just because the data is available in the recreational sector, but I would like just some further information from the Science Center, and maybe they can do that for the next meeting. Thank you.

CHAIRMAN GUYAS: Thanks, Kevin. I'm going to go to Dr. Calay, and she's got her hand up.

DR. SHANNON CALAY: We would be happy to prepare a short response in time for the next council meeting. I think that's the quick answer.

CHAIRMAN GUYAS: I love it. It's so great.

MR. ANSON: Thank you. I appreciate it. Thank you very much.

CHAIRMAN GUYAS: All right. With that, I think that wraps up all of our Other Business. The other items that we didn't get to I guess will be on ice for a future meeting, and I will pass it back to Dr. Frazer.

(Whereupon, the meeting adjourned on October 27, 2020.)
