

SEDAR 79: Mutton Snapper Pre-Assessment Webinar

FWRI Stock Assessment Group

St. Petersburg, FL

11/28/2023

I CAME IN LIKE

A BUTTERBALL

Updated Schedule

- **Reason for delaying assessment: To allow time to calibrate the FWC State Reef Fish Survey to the MRIP FES time series and use as a sensitivity or base run input**
- Assessment Milestone I webinar.....week of February 19th, 2023
- Assessment Milestone II webinar.....week of April 1st, 2024
- Assessment Milestone III webinar.....week of May 13th, 2024
- Assessment Milestone IV webinar.....week of July 7th, 2024
 - Goals: Review sensitivities and uncertainty evaluations. Review projection results. Review Assessment report and responses to ToRs
 - Depends on data being available by **mid-May or early June** at the latest. Gives 1-1.5 months to run 2 models (data through 2023, and data through 2023 and SRFS)
- Review Workshop: (St. Petersburg, FL).....September 10-12, 2024

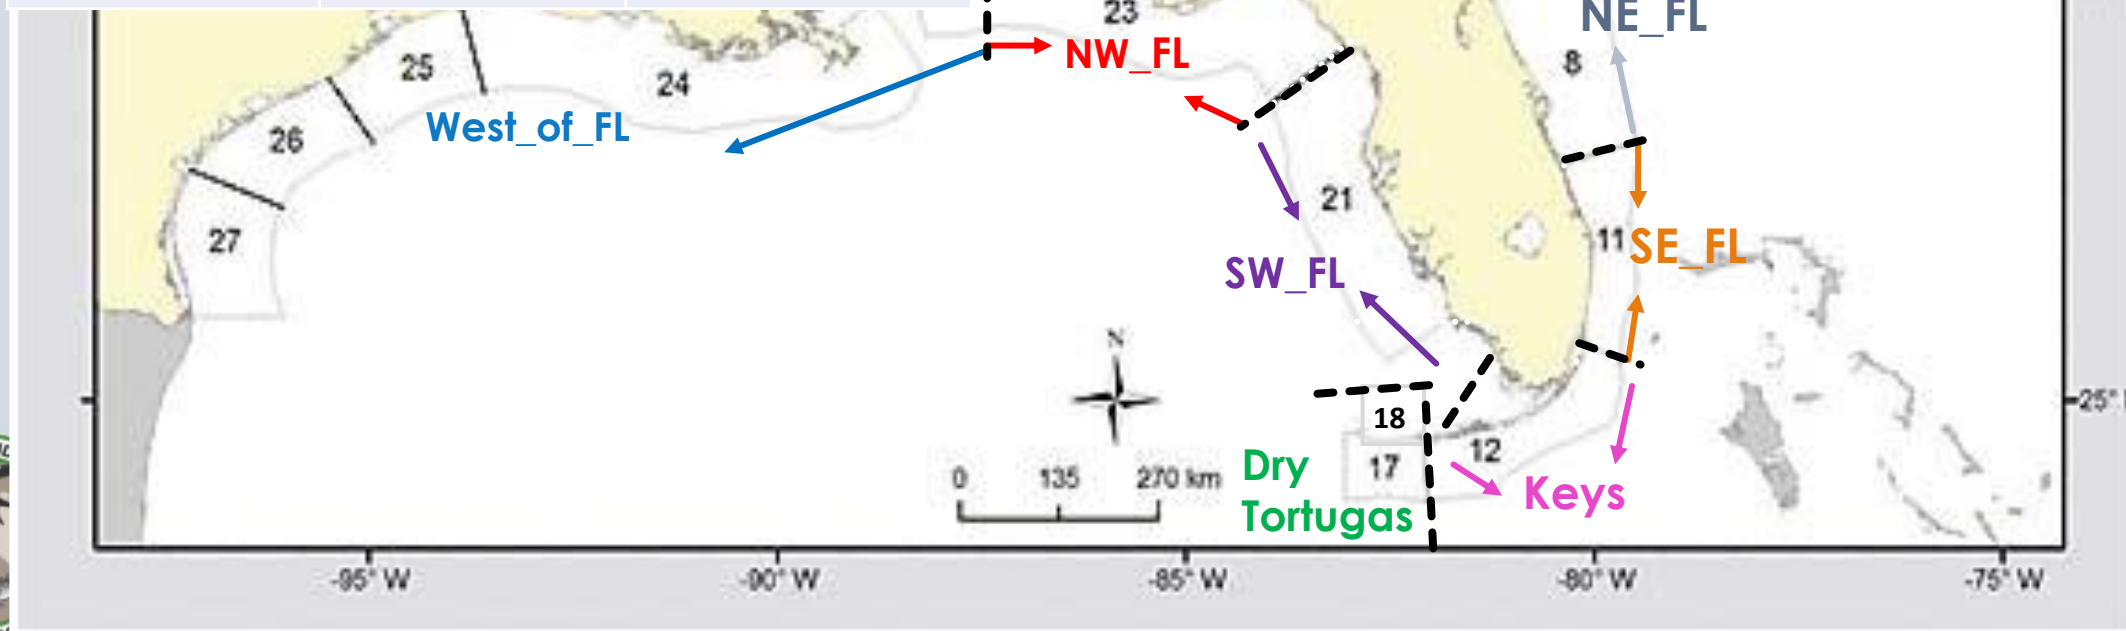

Goals

- Discuss any remaining data and/or pre-modeling issues
- Review and finalize any data changes or modifications since the DW
- Review methods to develop age-length keys and weighted length and age compositions
- Consider methods and configuration options for models
- Recommend assessment methods (i.e., model classifications, packages) to pursue for potential base model configuration
- Identify likely issues to be addressed and evaluated in developing the base model

Region Caught	Statistical Grids	SRHS
West_of_FL	11 - 21	24 -29
NW_FL	7-10	~23
SW_FL	3-6	21, old 22
Dry Tortugas	2	Old 17, old 18
Keys	1, 2479-2482	12 (pre-2013 definition)
SE_FL	2580,2680,2780, 2579,2679,2779	11
NE_FL	2880,2980,3080, 2879,2979,3079	7, 8
North_of_FL	North of 31°	1 – 6, 9,10

Updated Data Sources Since Data Workshop

- Commercial landings in numbers
- MRIP landings, discards, CVs, and lengths by region: East (SE FL and north) and West (FL Keys and west)
- FIM Inshore Seine YOY index updated through 2022
- A few age records were corrected (n=56) as well as some trip identifiers in Age/Length data
- SRHS landings, discards, and bio samples by region caught (i.e., fish caught in the Dry Tortugas are identified)

Expected Data Sources

- Through 2022
 - GOM Camera Survey Index (Jan 2024)
- Through 2023 (available by May/early June 2024 at the latest)

- Landings

- MRIP
- SRFS
- COM
- HB

- Discards

- MRIP
- SRFS
- COM
- HB

- Indices

- RVC
- SERFS Cam
- GOM Cam Survey
- FIM YOY

- Lengths

- MRIP
- COM
- HB
- RVC
- FIM YOY

SCRFA.org

Landings-Weighted Length Frequencies

Commercial

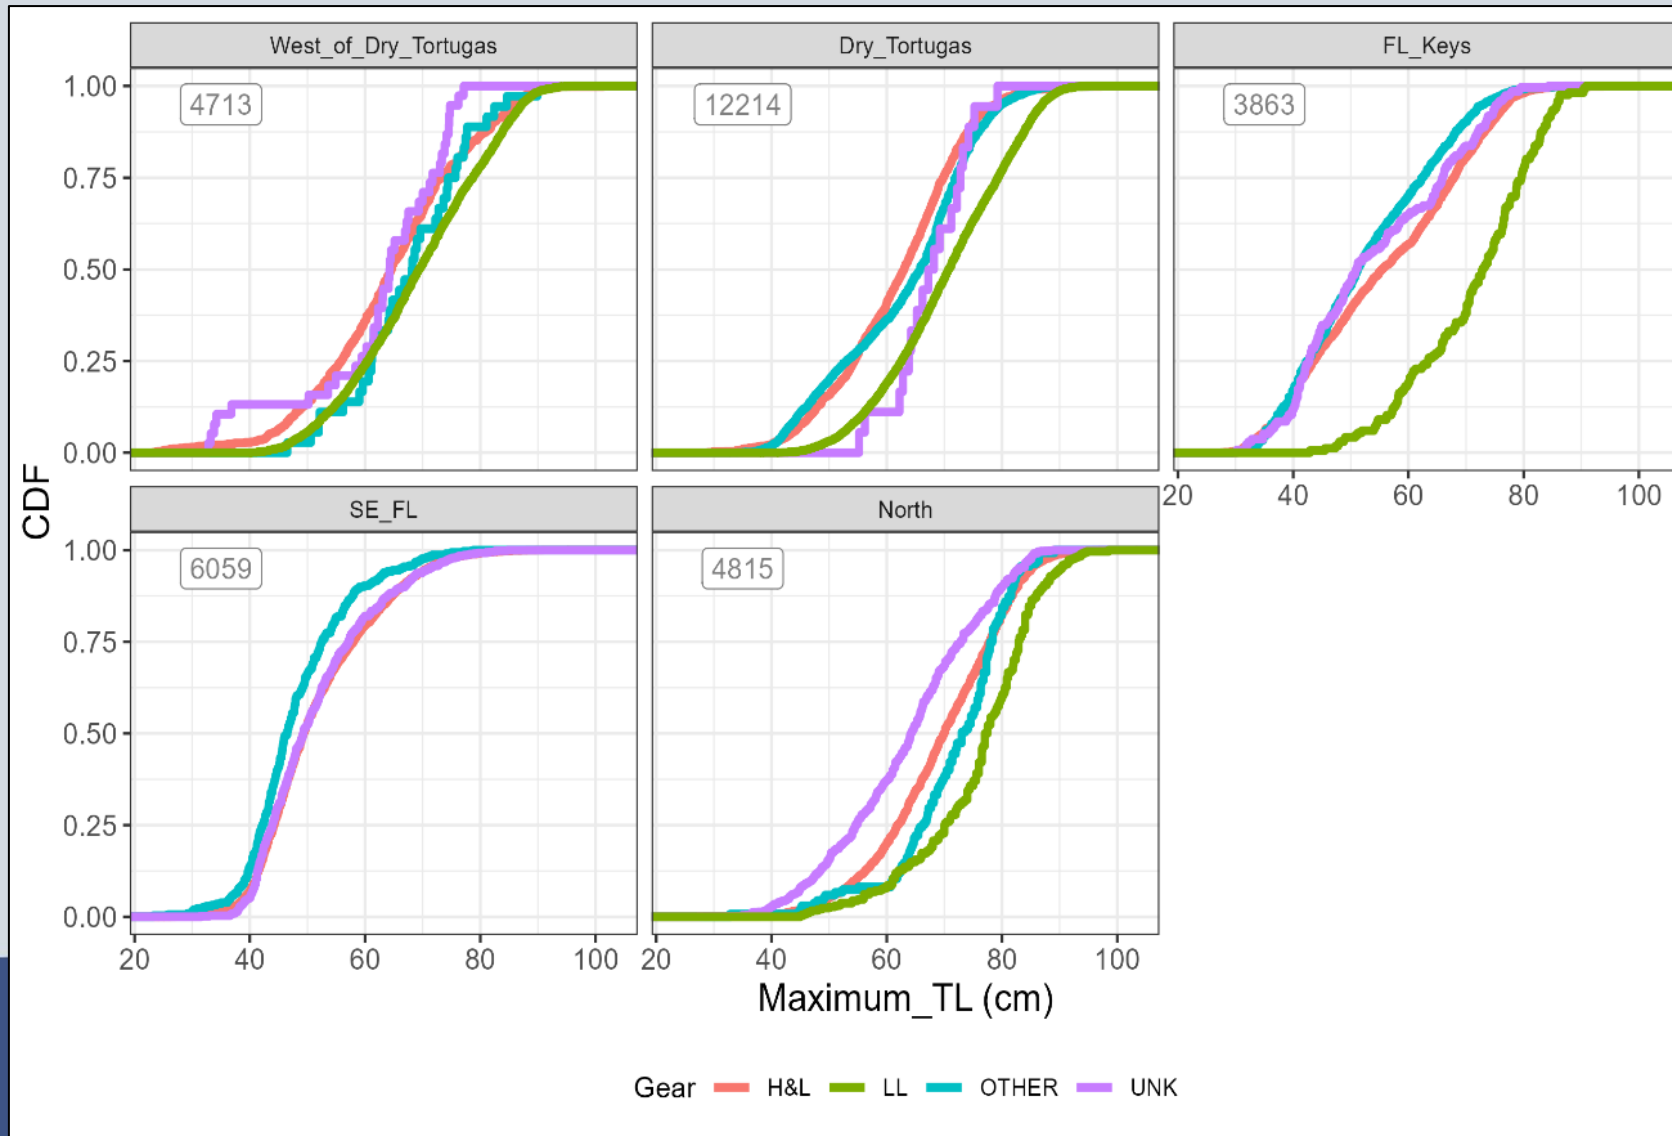

Why weight sampled lengths and ages?

- Size samples are often collected unevenly in space and time.
- To be representative of the size of fish being removed by fisheries, statistical correction of size composition data is required by reweighting using either landings or releases.
- Do so in a way that removes apparent noise in fishery-level size compositions driven by strata with low levels of sampling (WCPFC-SC19-2023).

Commercial lengths by Gear and Region

Commercial Landings by Gear

- Low landings from 'Other' geartypes
- Length distributions are mostly similar among hook and line, other, and unknown geartypes. Some differences observed but sample sizes are low
- **Decision: Keep Longline gear separate and combine Hook and Line, Other, and Unknown gears.**

Commercial Longline Retained Lengths

Commercial Longline Landings By Region Caught

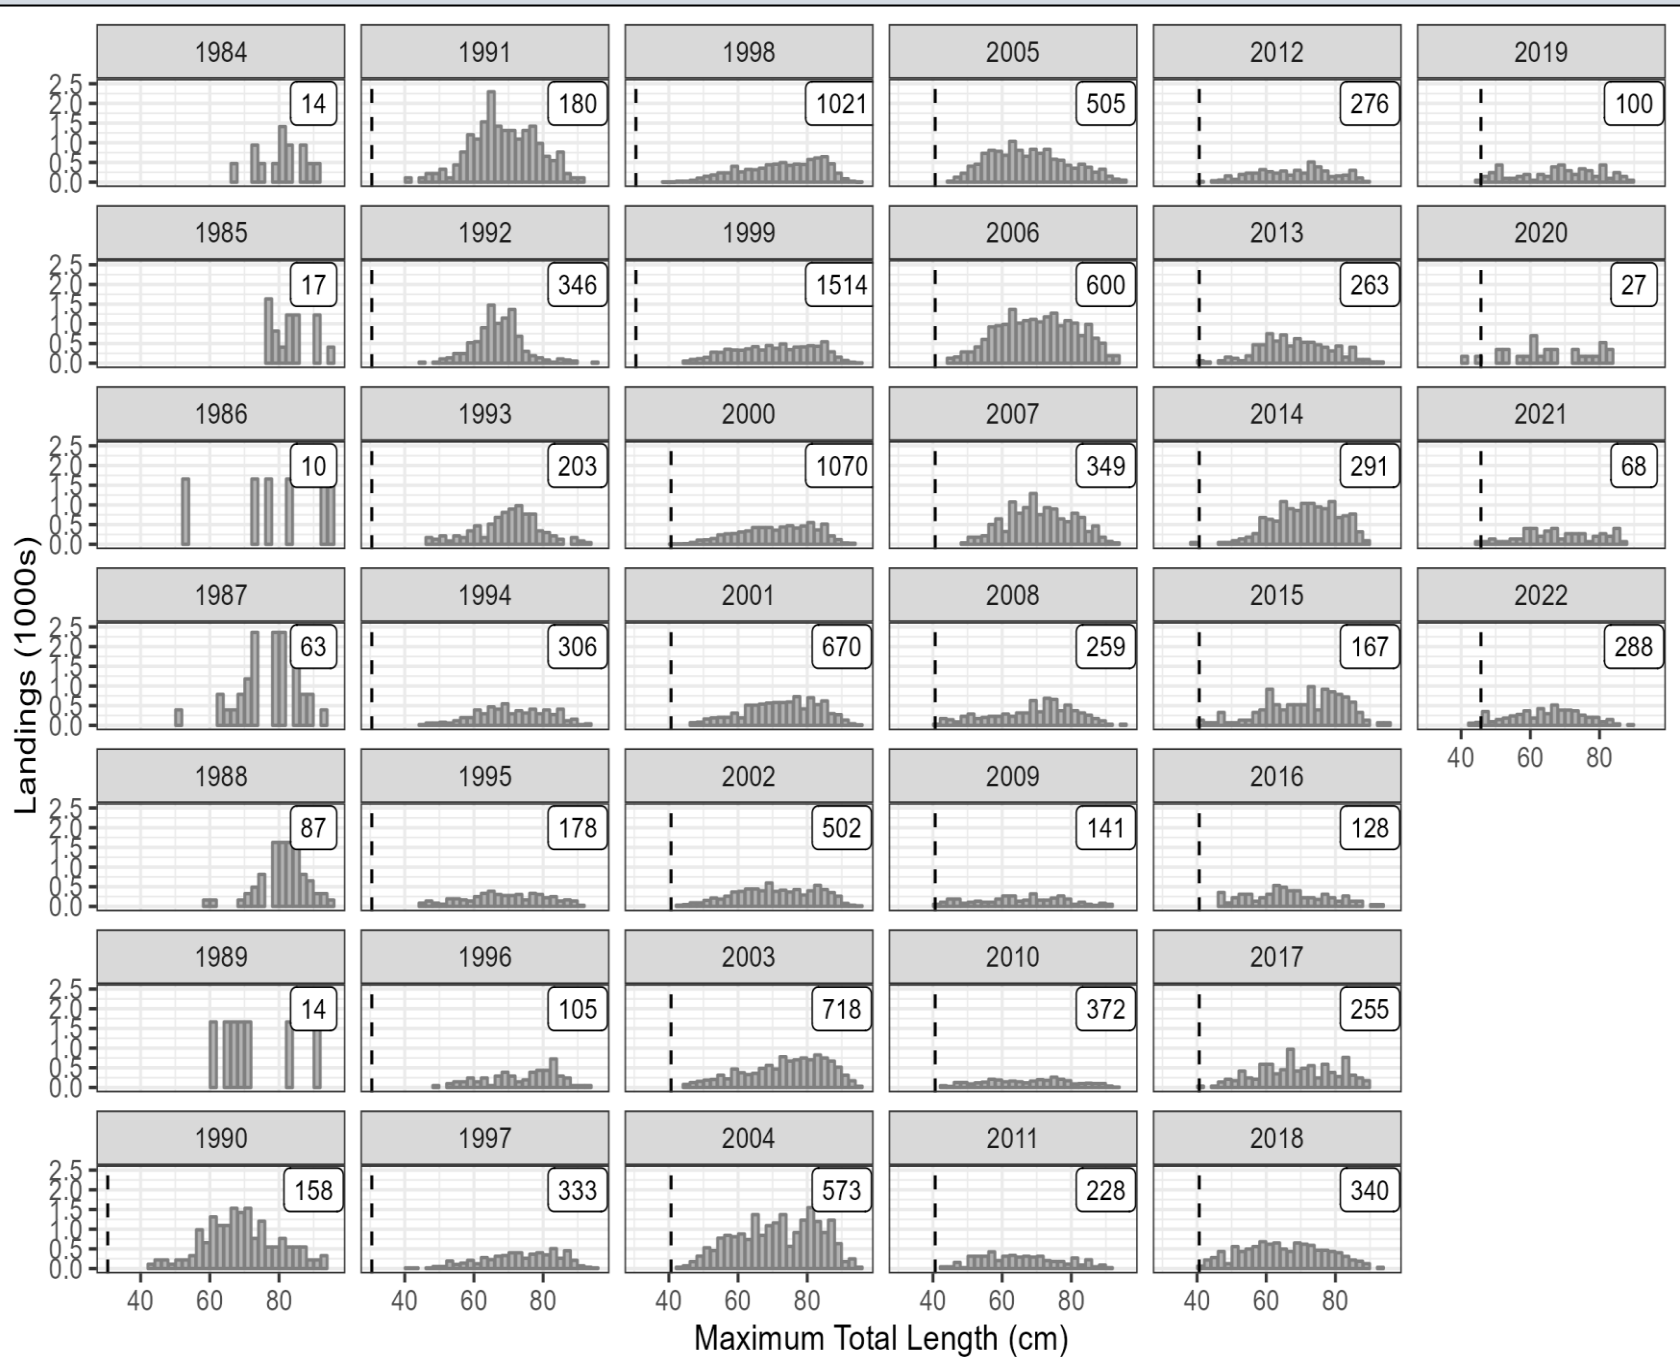

Explorations and Resulting Decisions

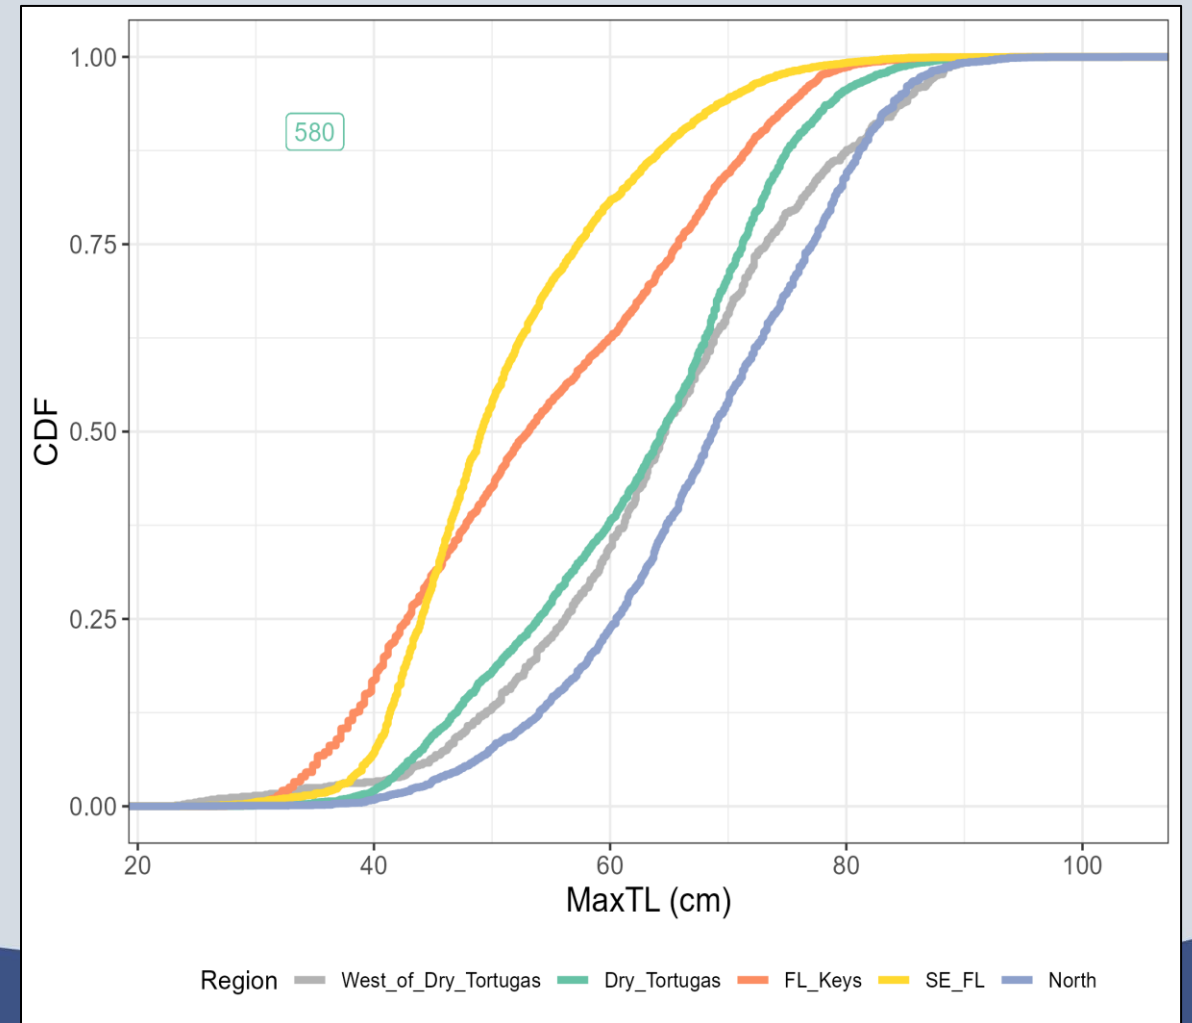

1. Sampled lengths from the longline fleet are very similar among regions and months.
2. **Decision: Combine sampled longline lengths across all regions and months and weight the length comps by annual longline landings.**

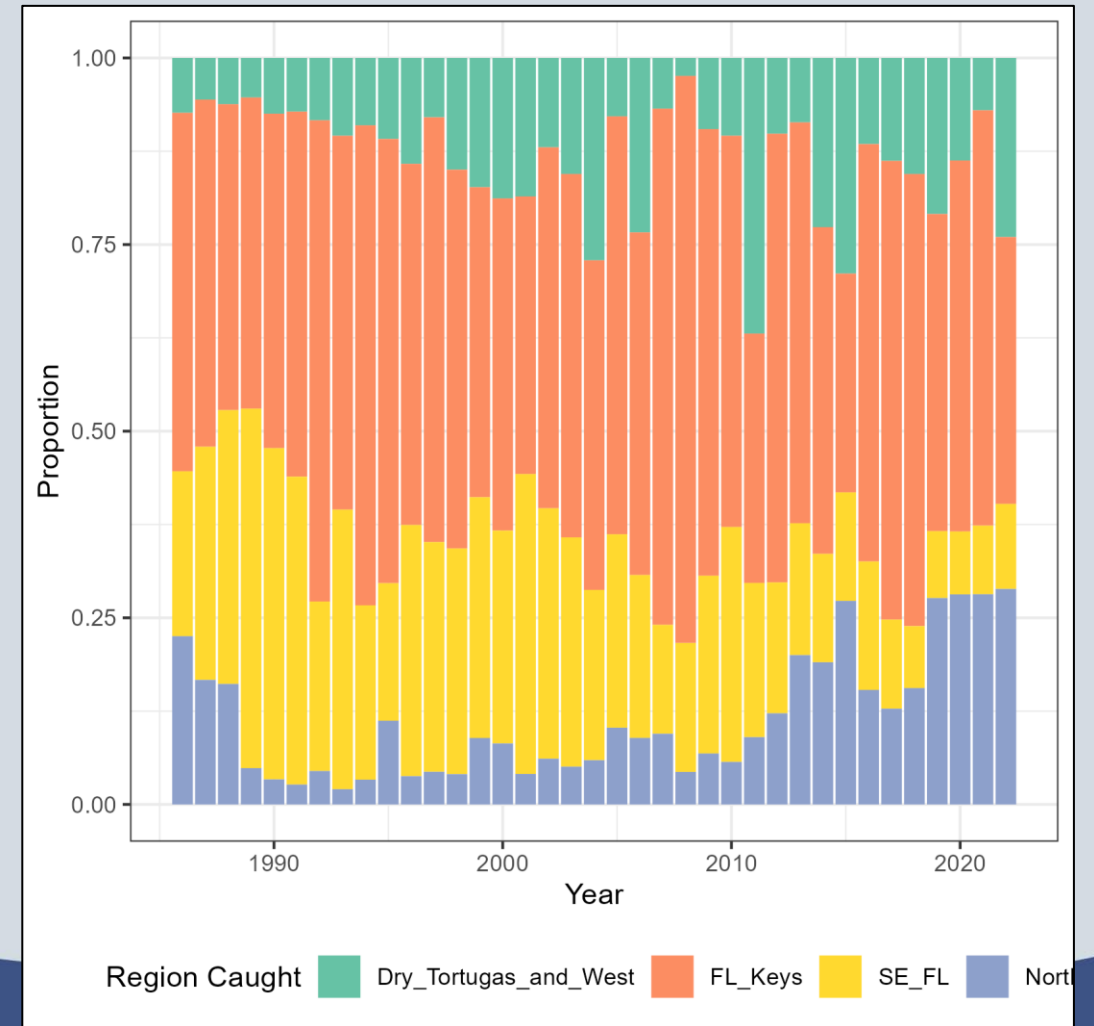

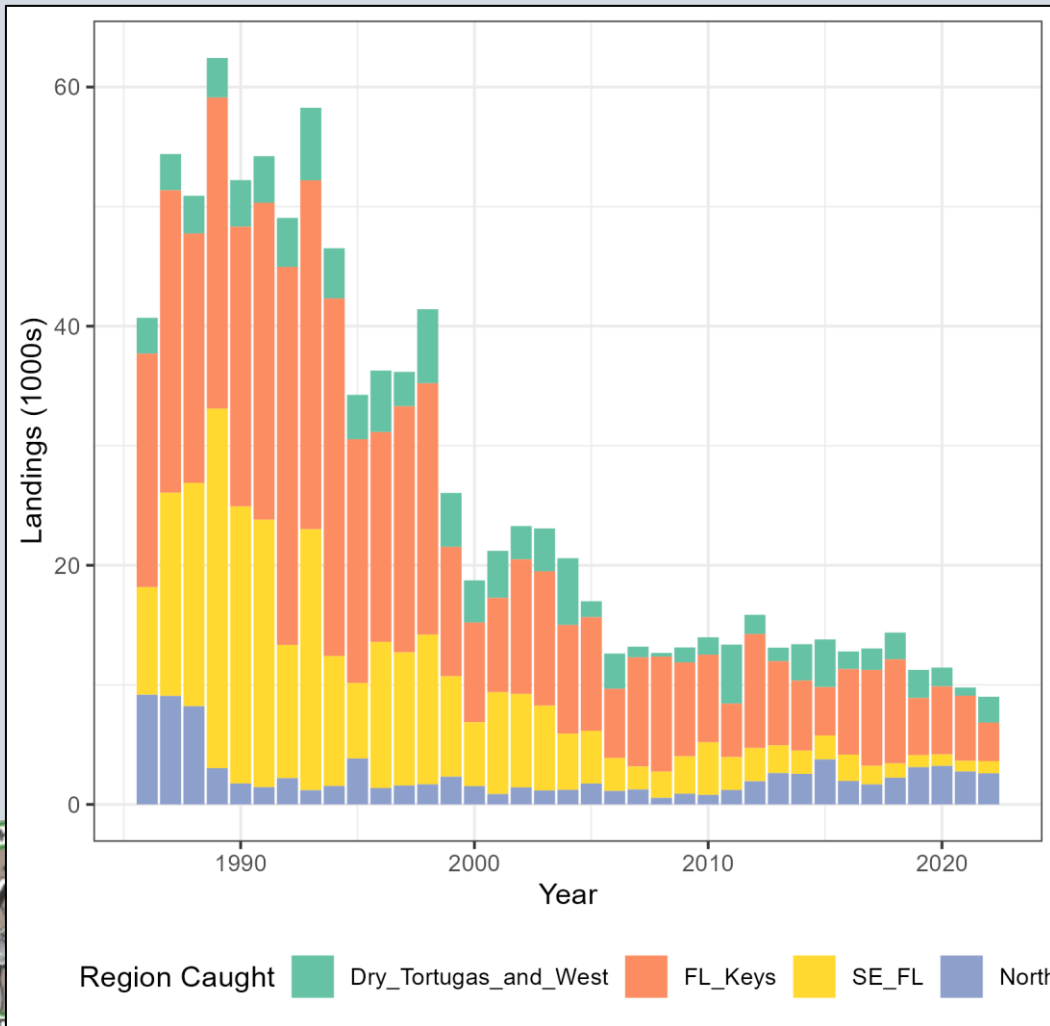

Commercial Longline Landings-at-Length

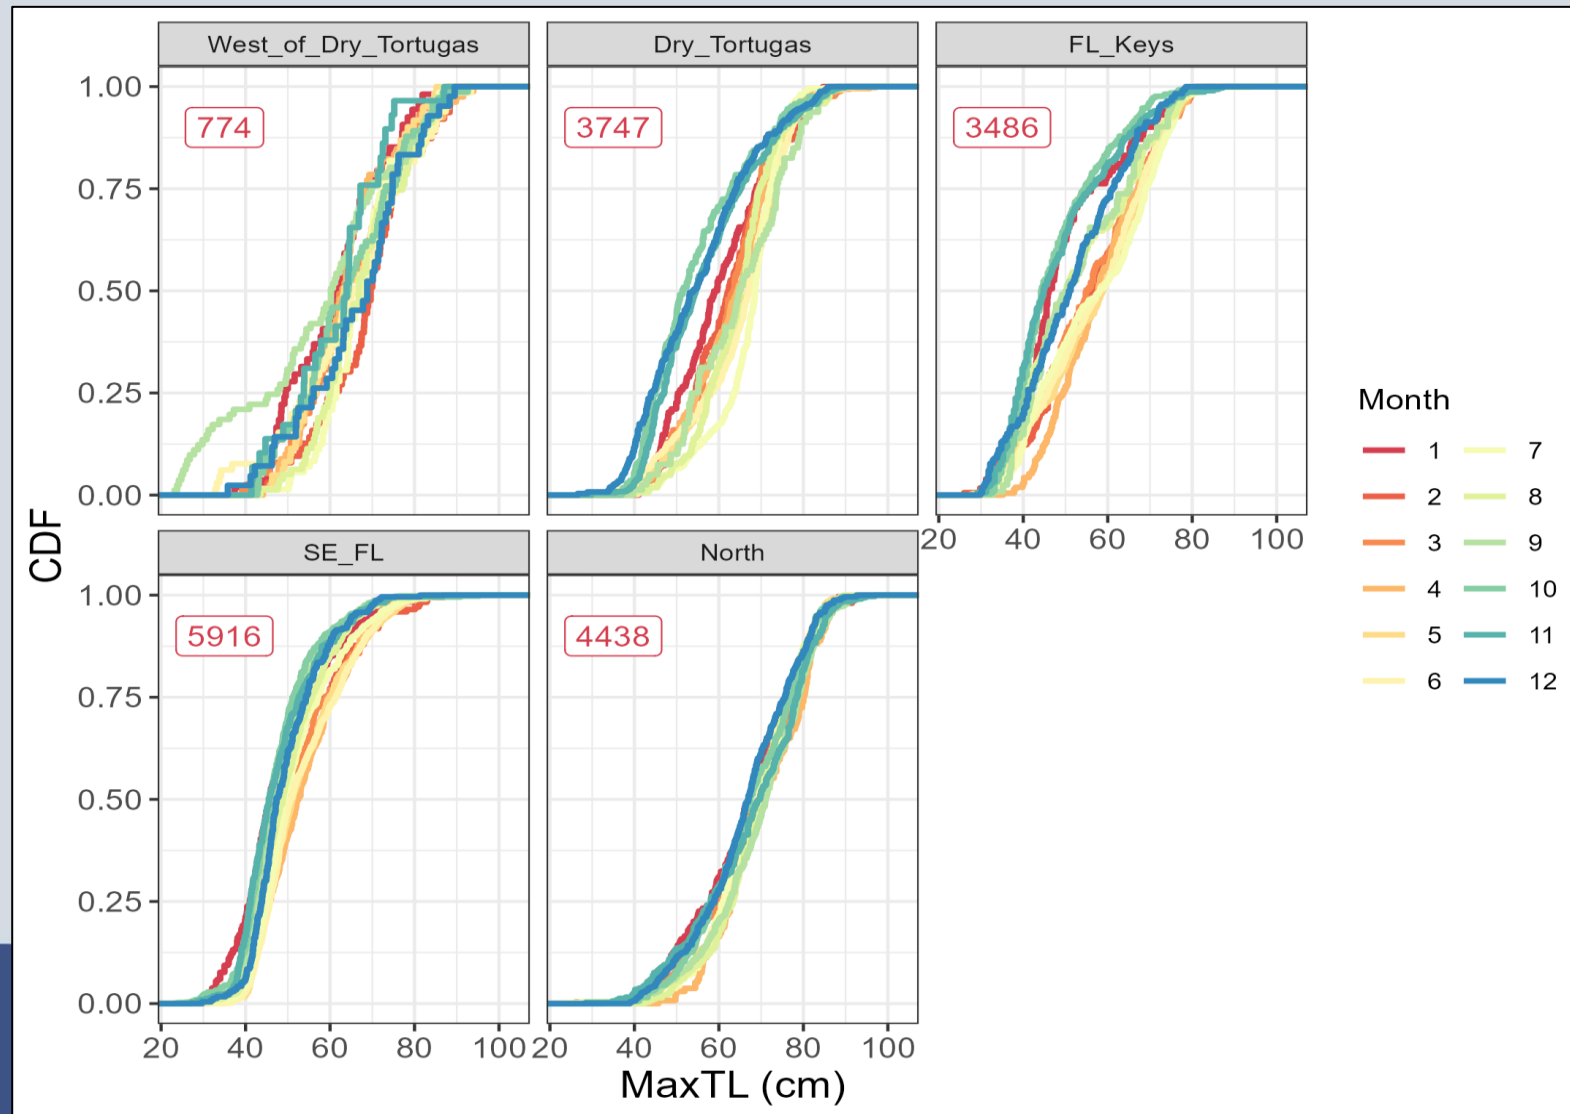

Commercial 'Other' Retained Lengths

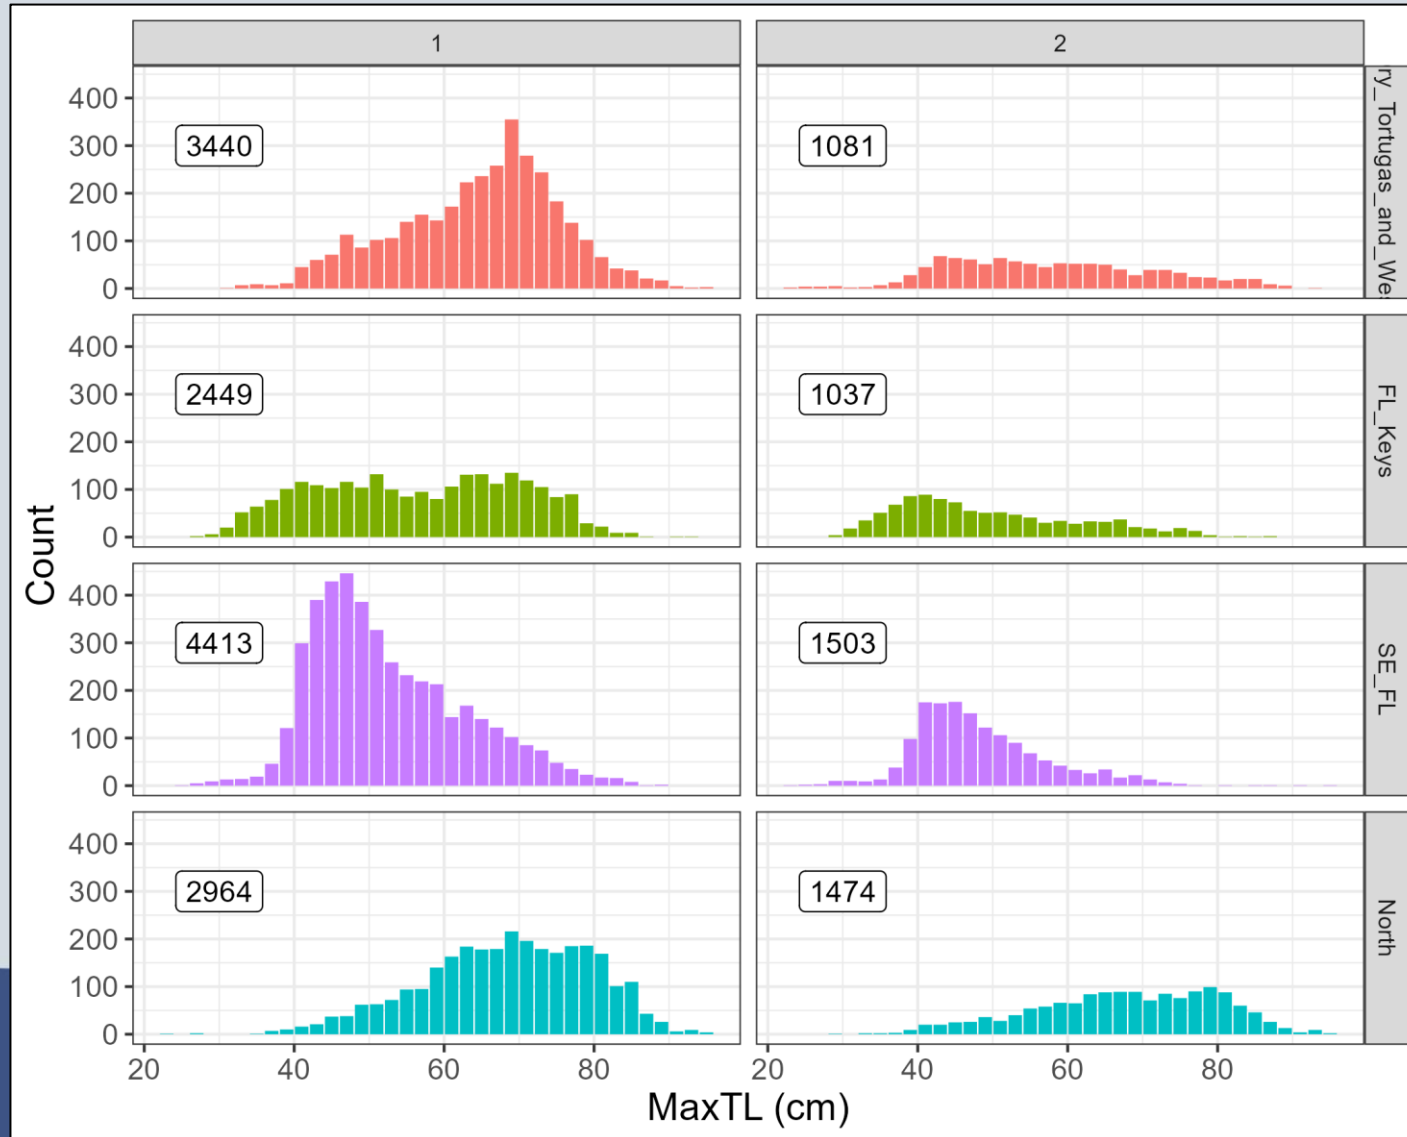

Commercial 'Other' Landings By Region Caught

Commercial 'Other' Retained Lengths

Commercial 'Other' Retained Lengths

Commercial 'Other' Retained Lengths

Commercial 'Other' Retained Ages

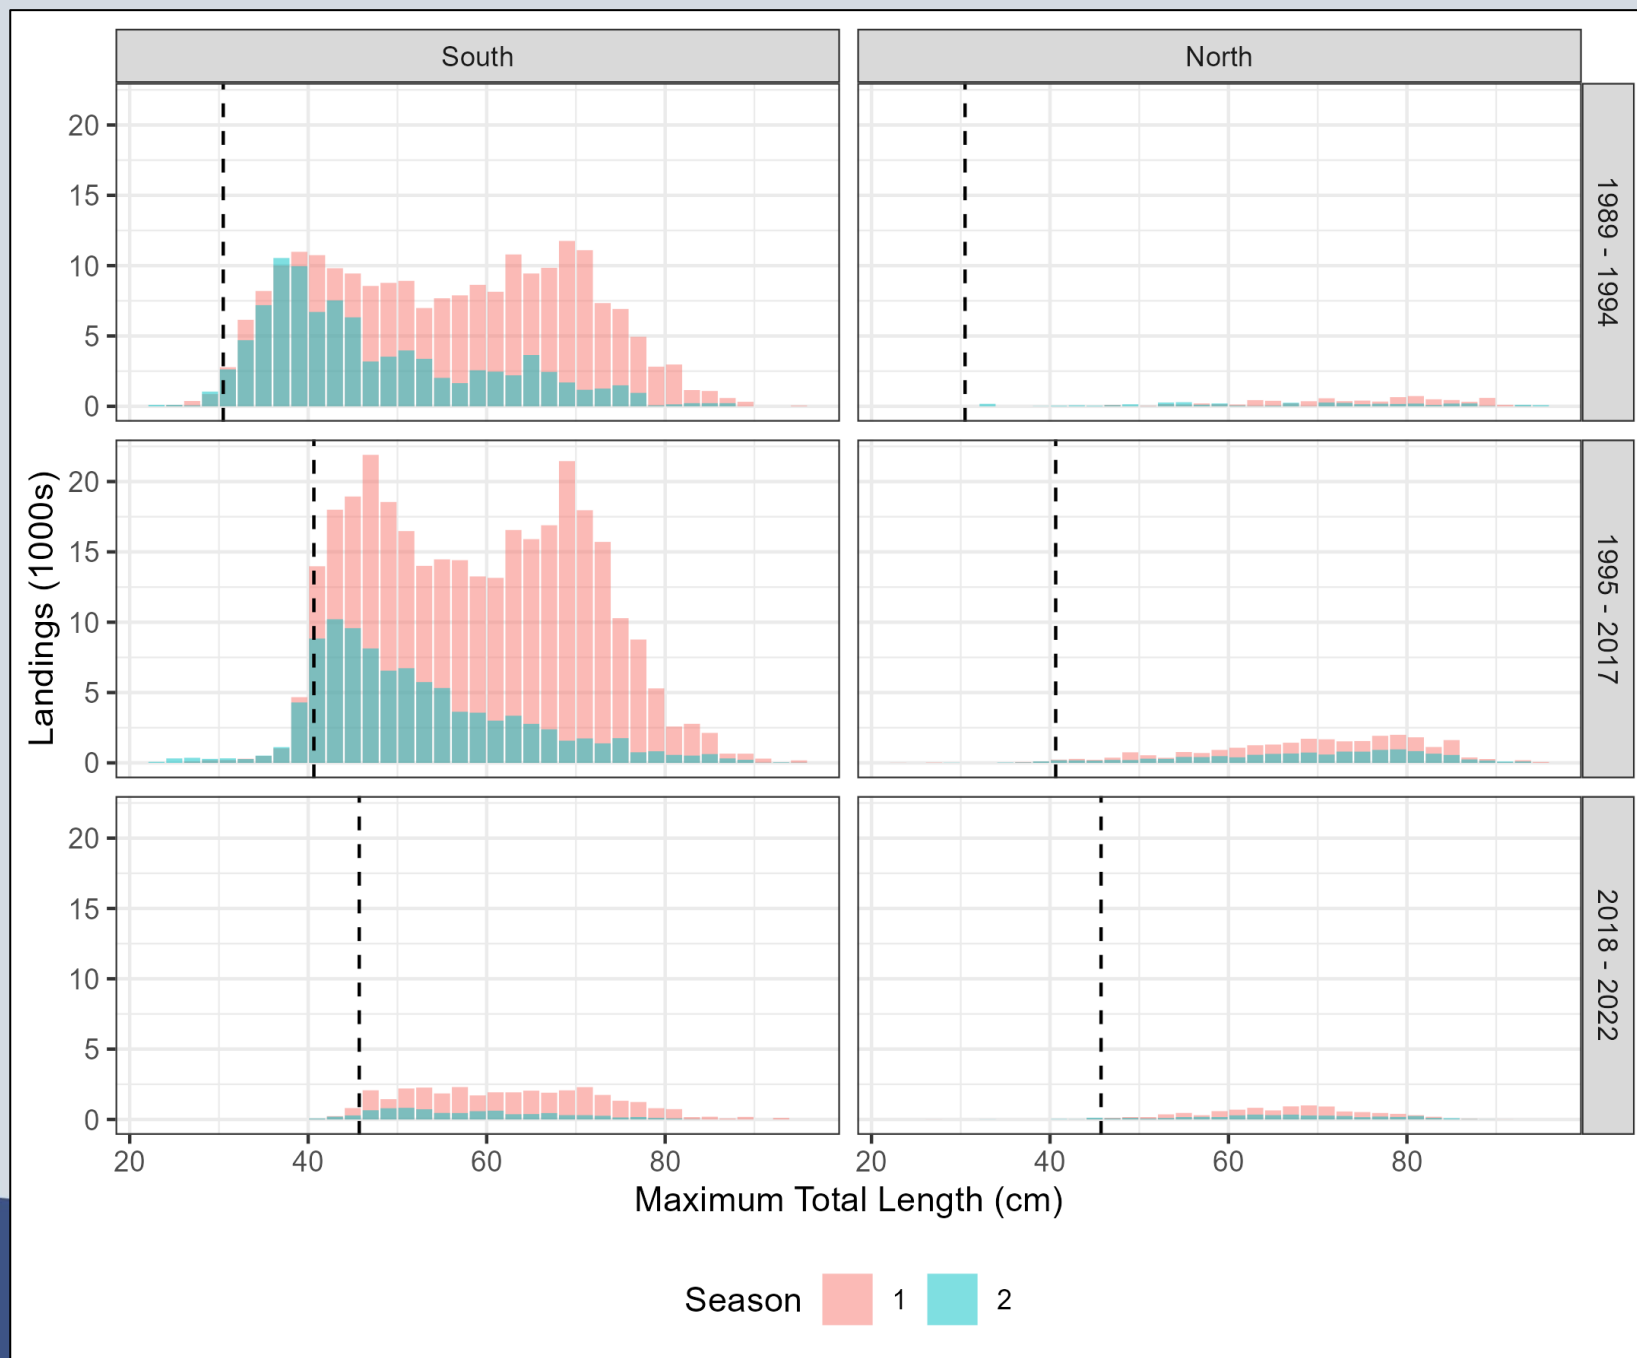

Explorations and Resulting Decisions

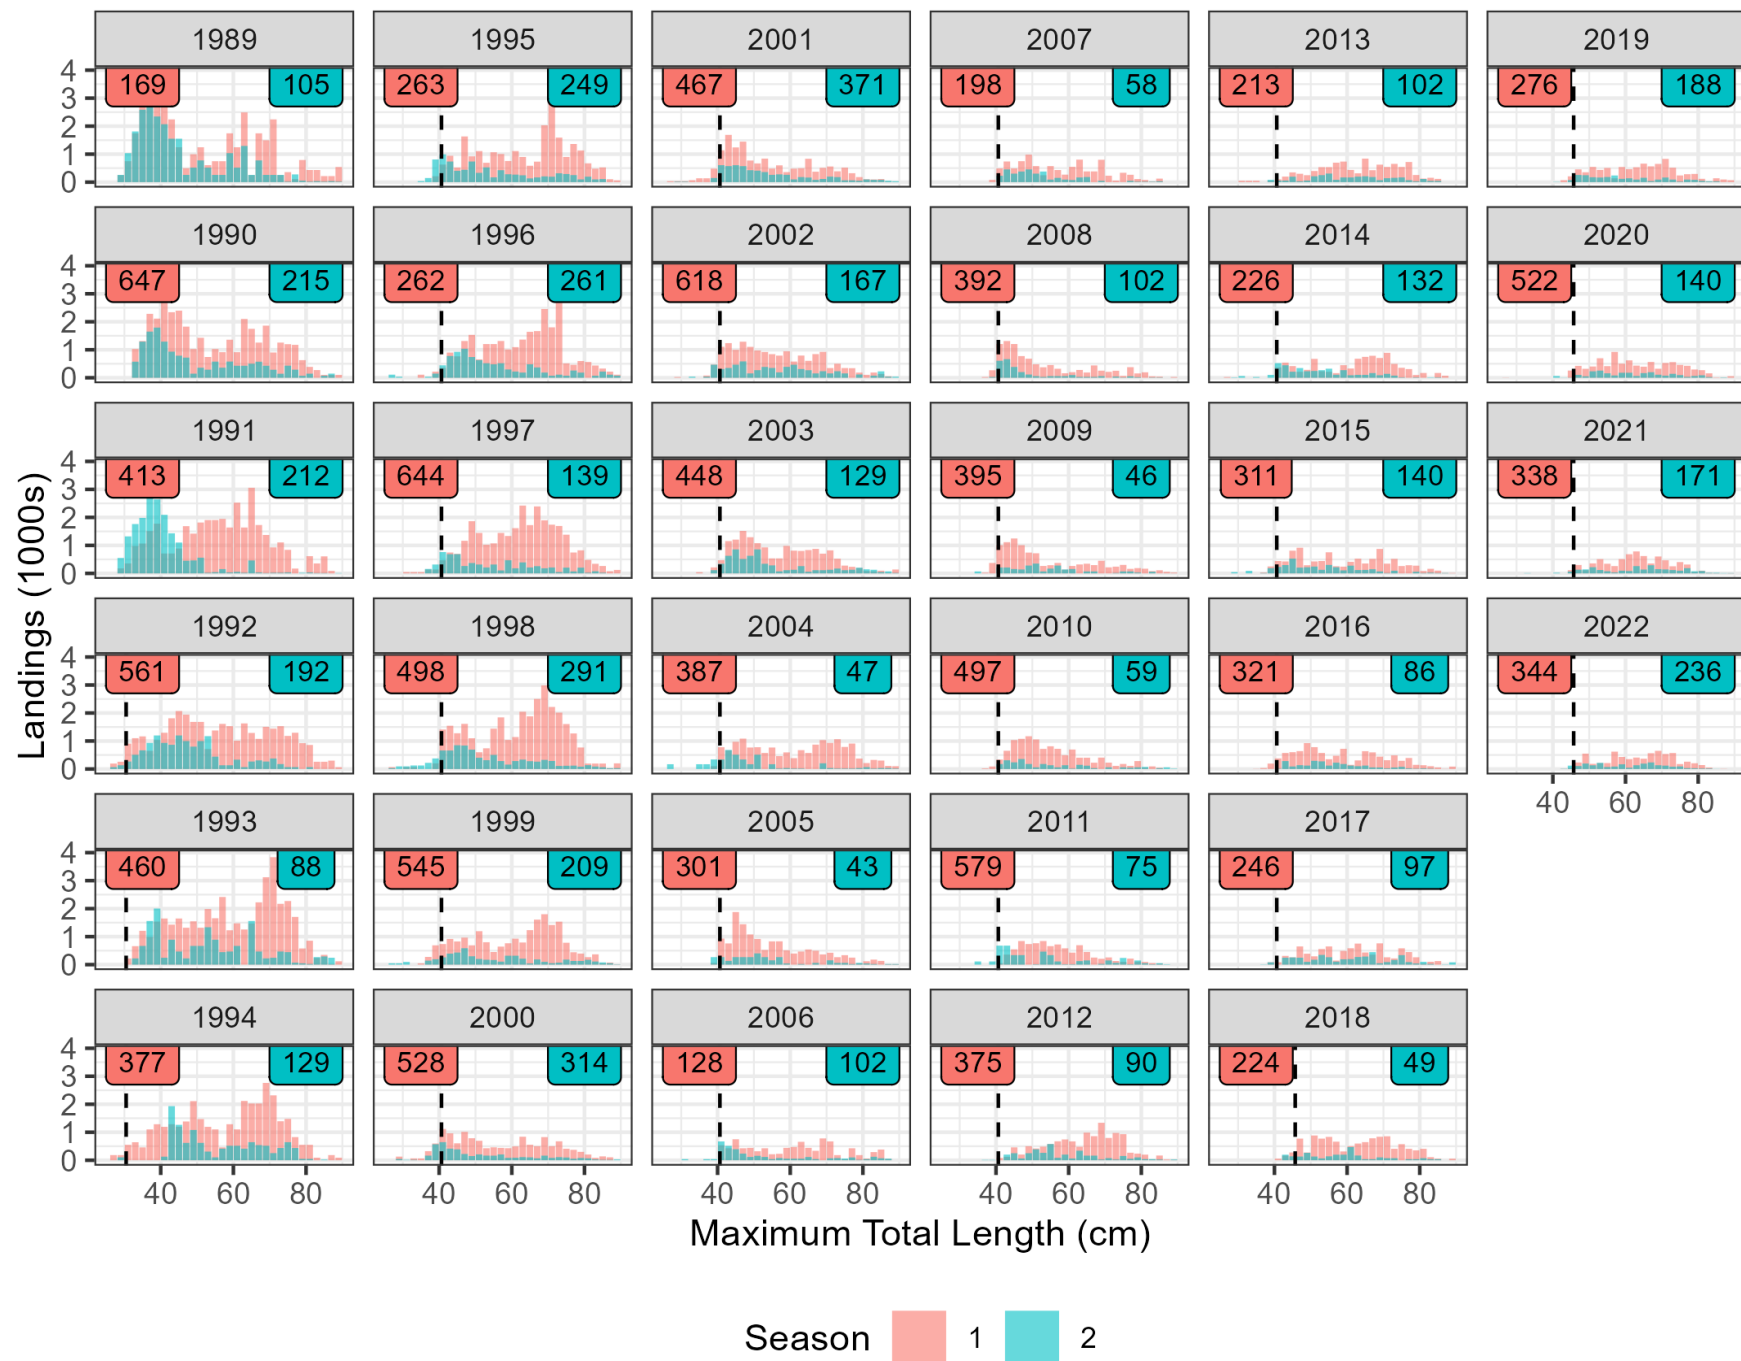

1. The FL Keys region makes up most of the landings since 1986. The proportion of landings from SE FL have steadily declined, particularly since 2013, but have increased in the North.
2. The sampled length and age comps for these regions differ enough to warrant weighting them separately. However, sample sizes are very limited, especially in the FL Keys from 1999 through 2007.
3. **Decision: Combine these three regions by season and weight the length comps by the landings by grouped region (North and South), season, and year.**

Commercial 'Other' Landings-at- Length

Commercial 'Other' Landings-at- Length

SCRFA.org

Landings-Weighted Length Frequencies

Recreational

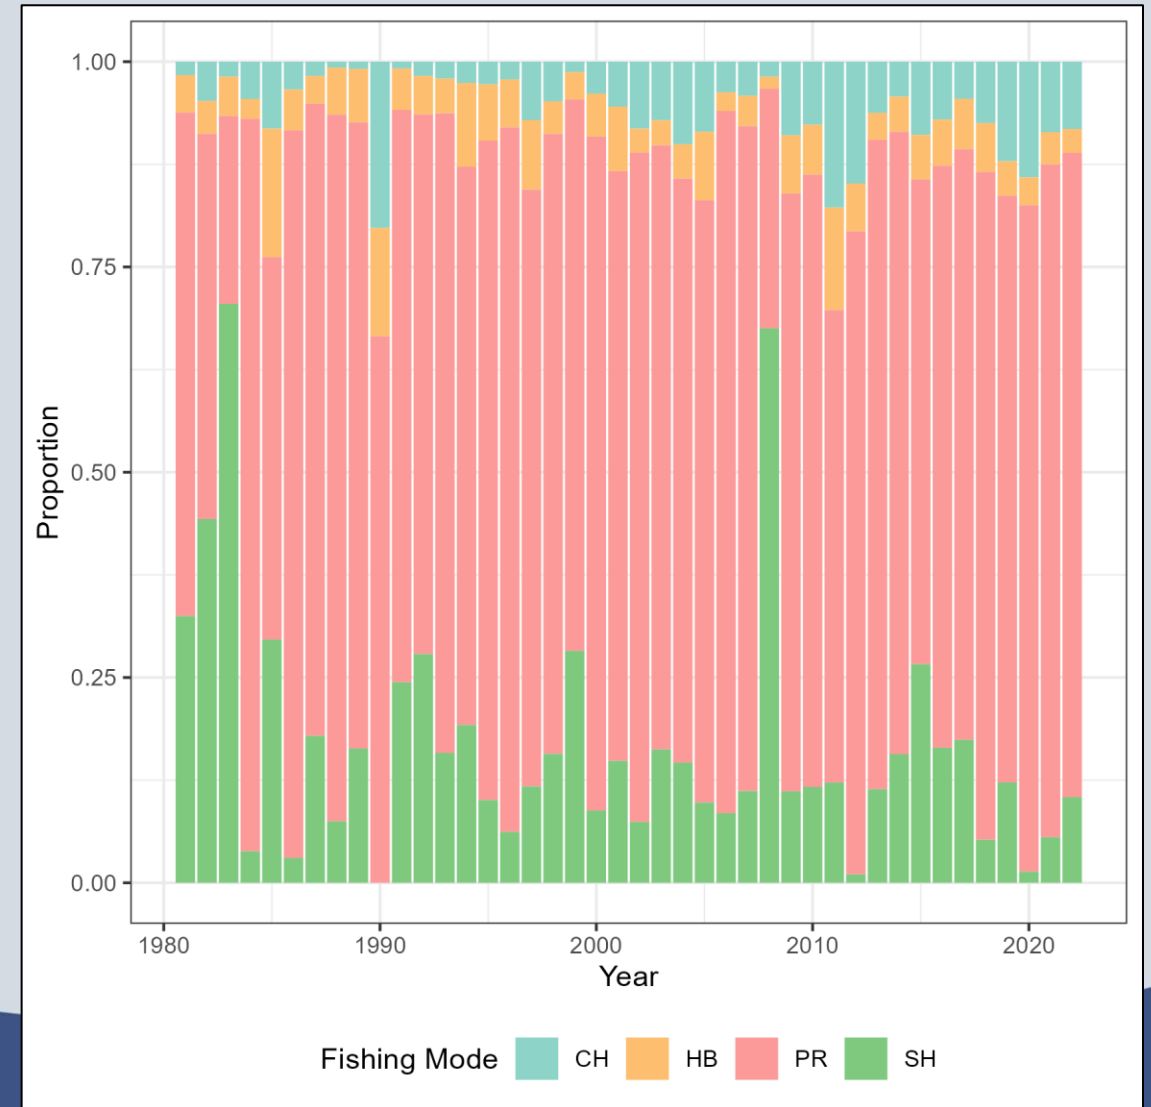

Recreational Retained Lengths

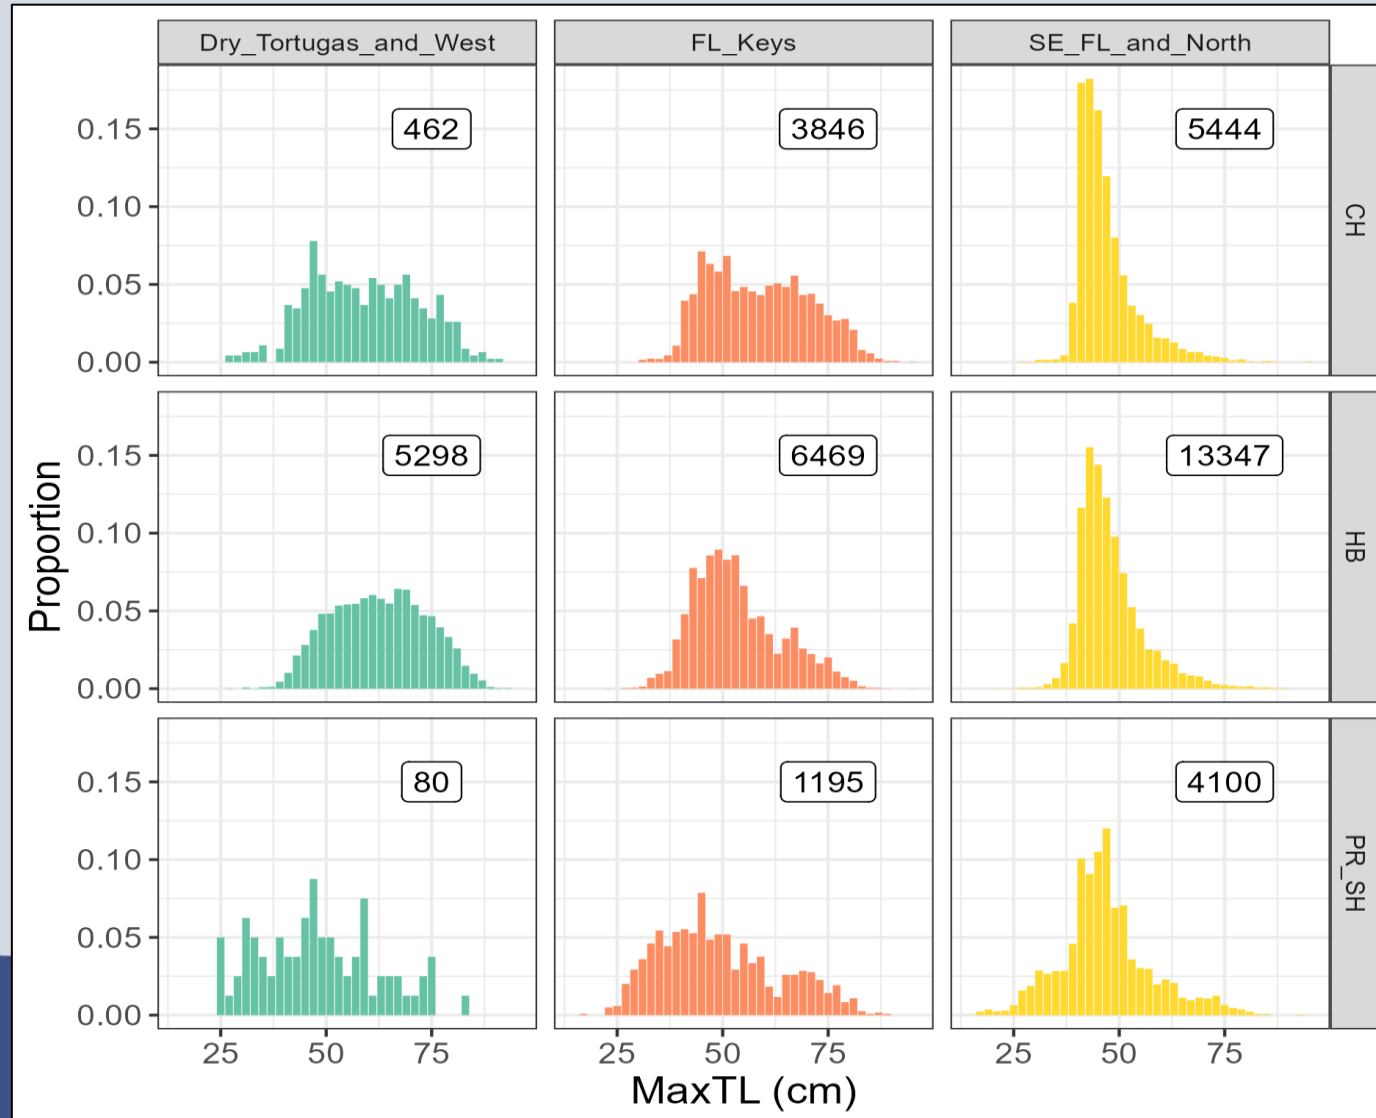

Recreational Landings By Region Caught

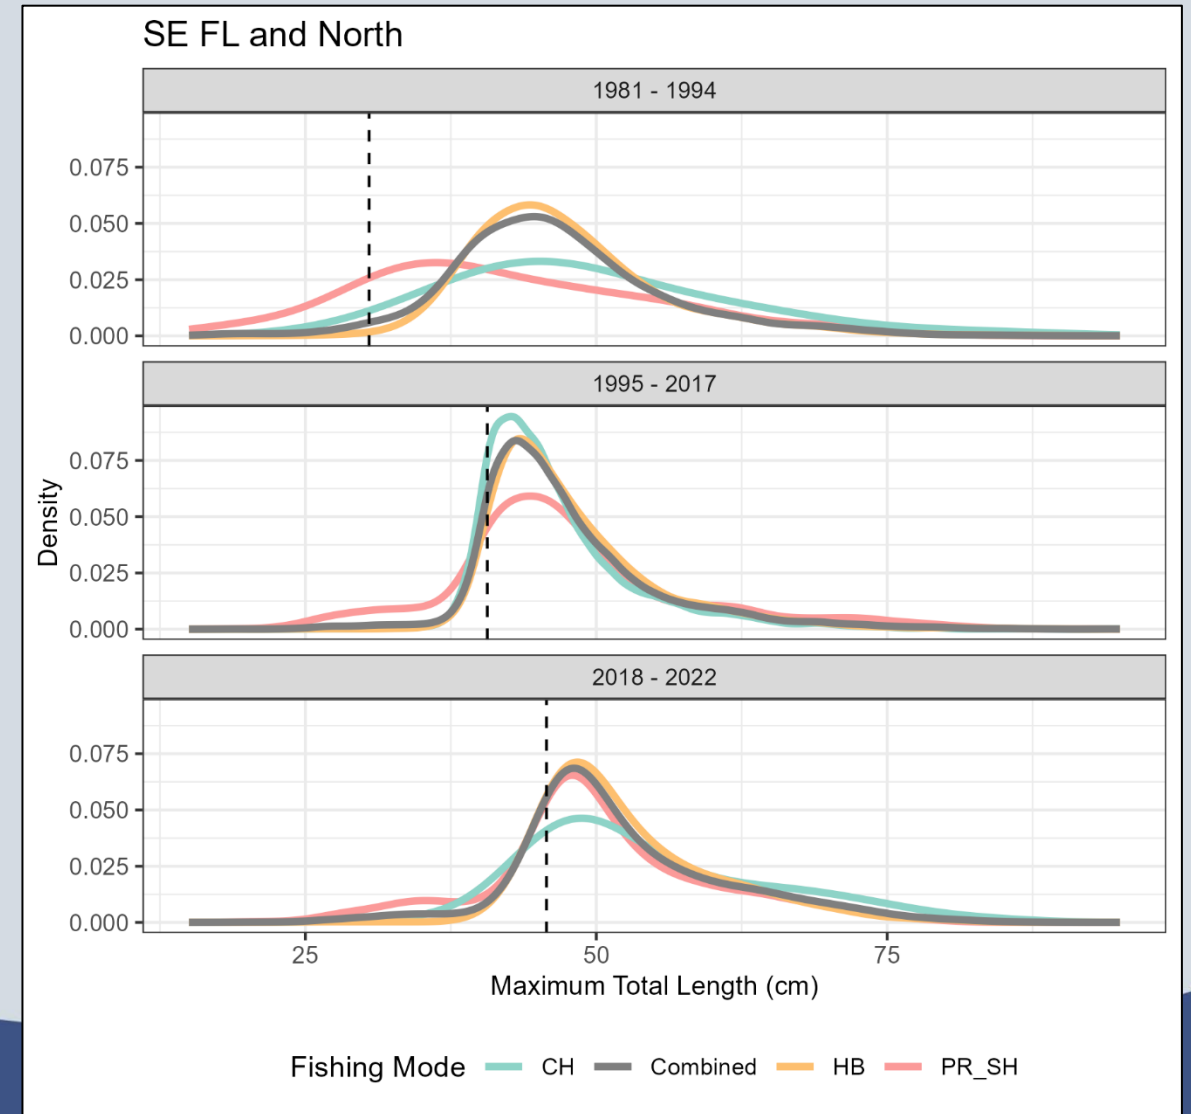

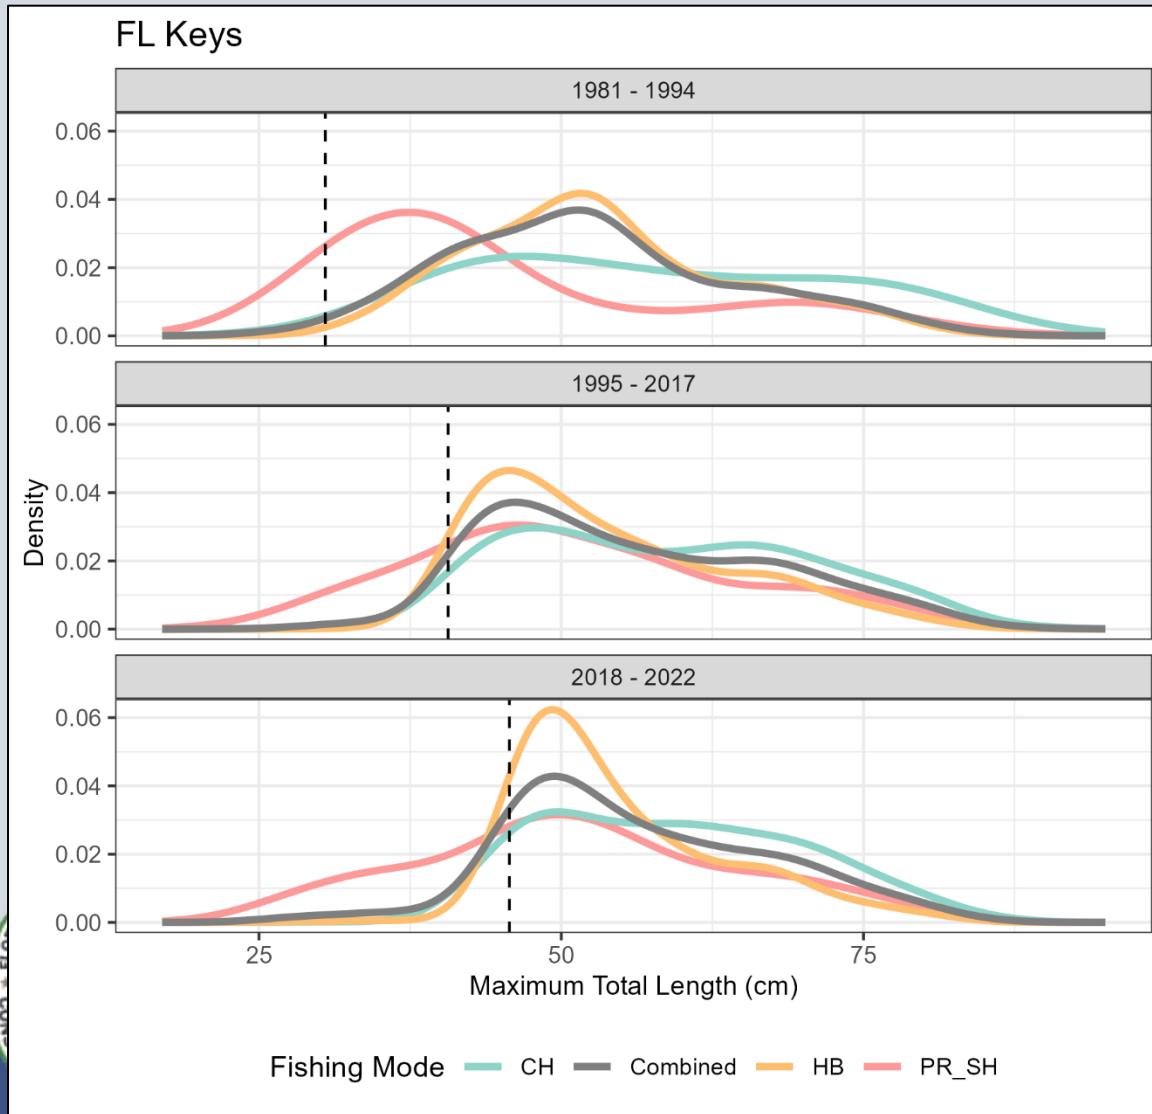

Recreational Landings By Fishing Mode

Recreational Retained Lengths

Recreational Retained Lengths

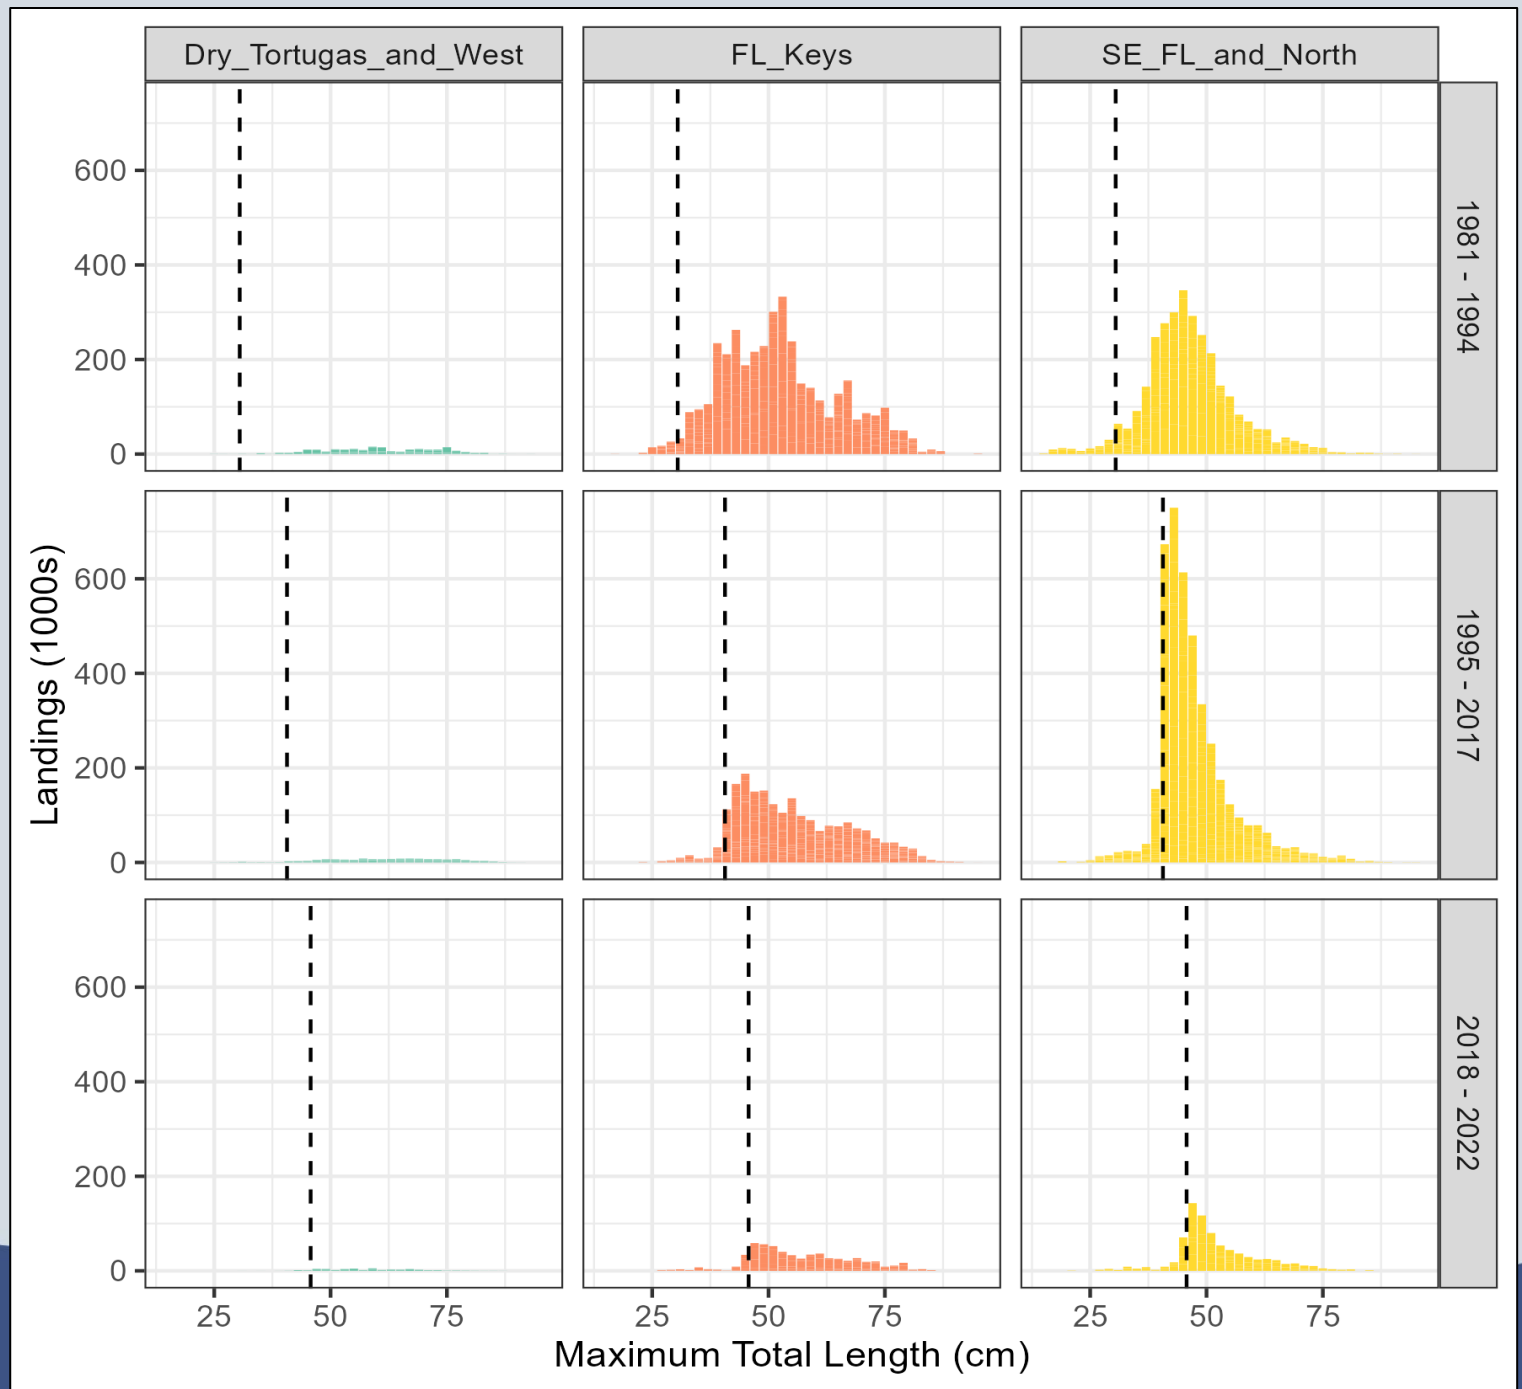

Explorations and Resulting Decisions

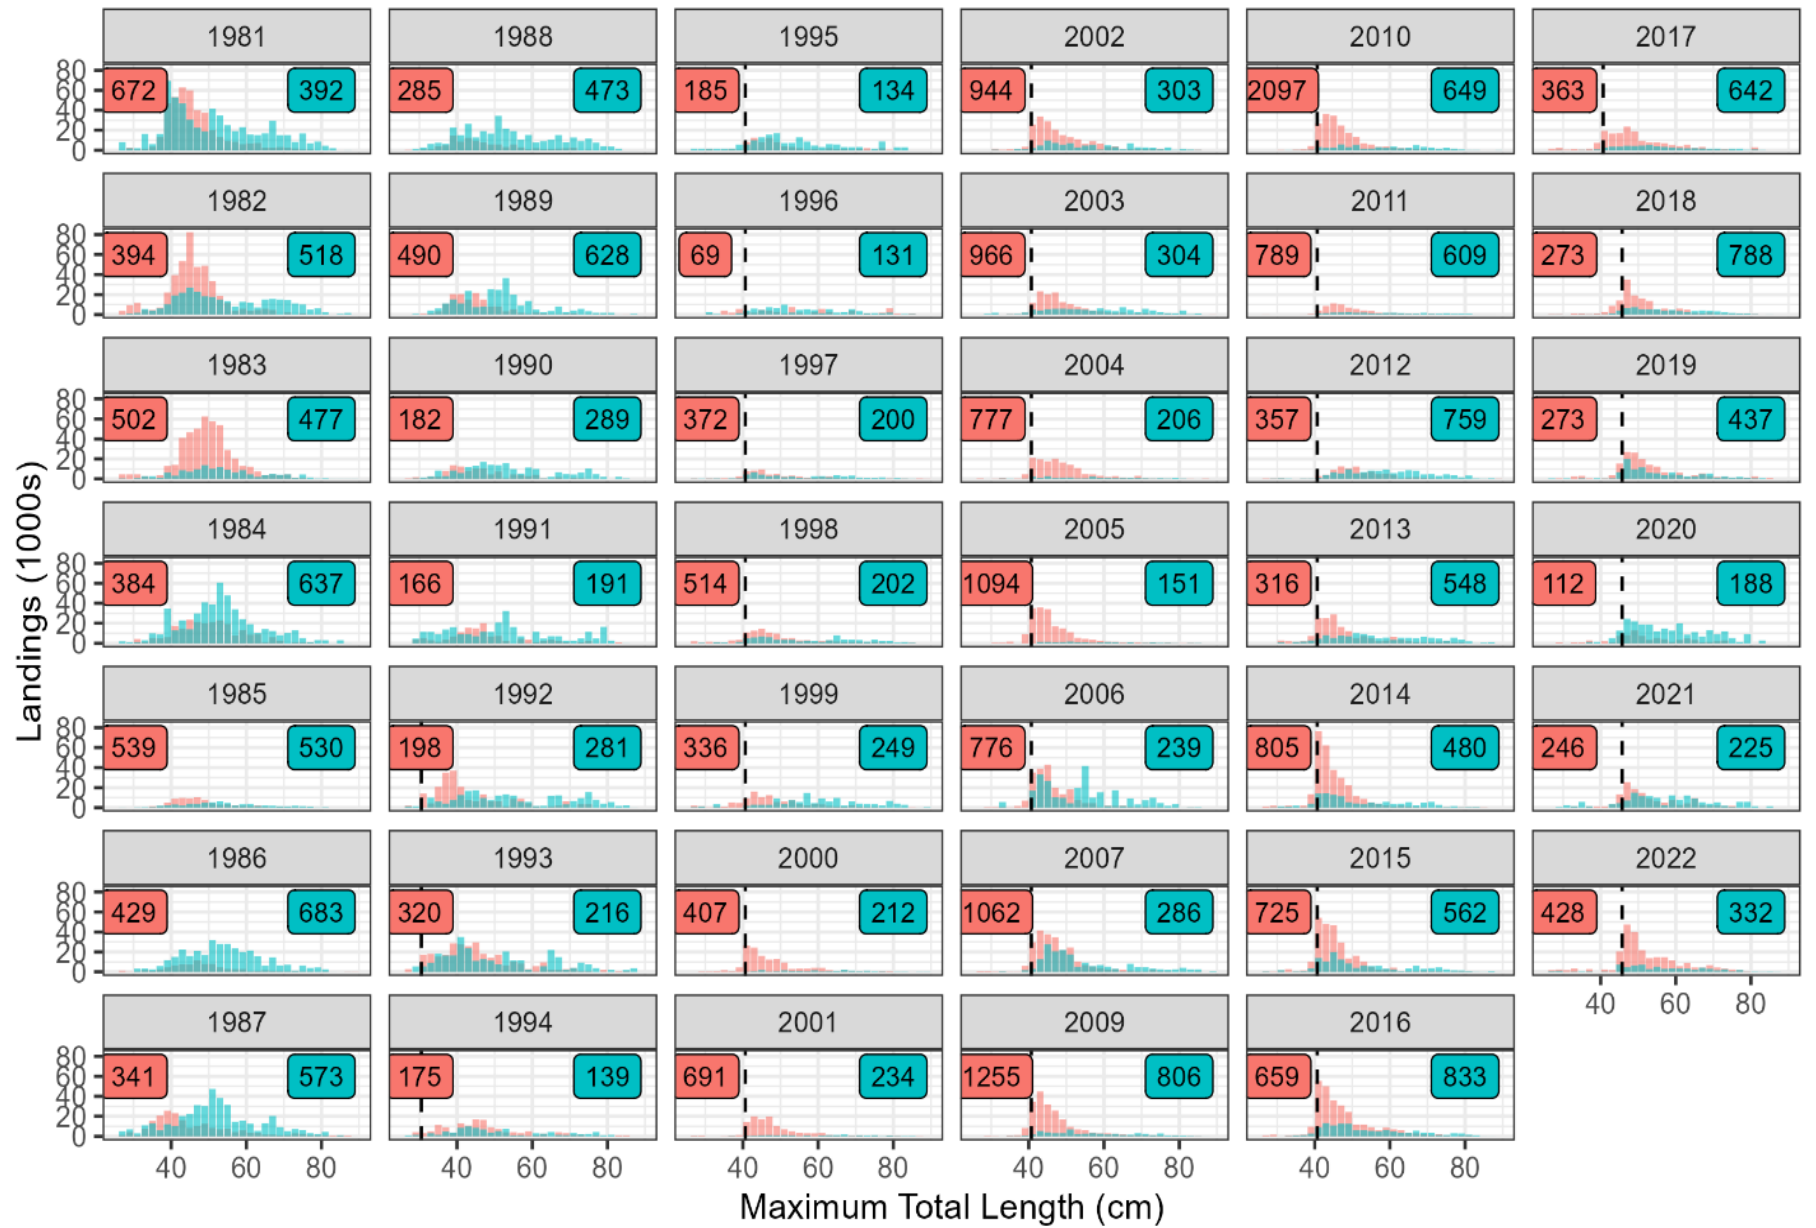

1. The FL Keys and SE FL account for most of the landings since 1981.
2. The private mode contributes the highest proportion of landings but few lengths.
3. The private mode may retain smaller fish compared to for-hire modes, particularly in the FL Keys. However, sample sizes are very limited and necessitate borrowing from other fishing modes.
4. **Decision: Combine sampled lengths across all fishing modes within regions and weight the length comps by the landings by region and year.**

Recreational Landings-at-Length

Discards-Weighted Length Frequencies

Recreational

Recreational Released Lengths

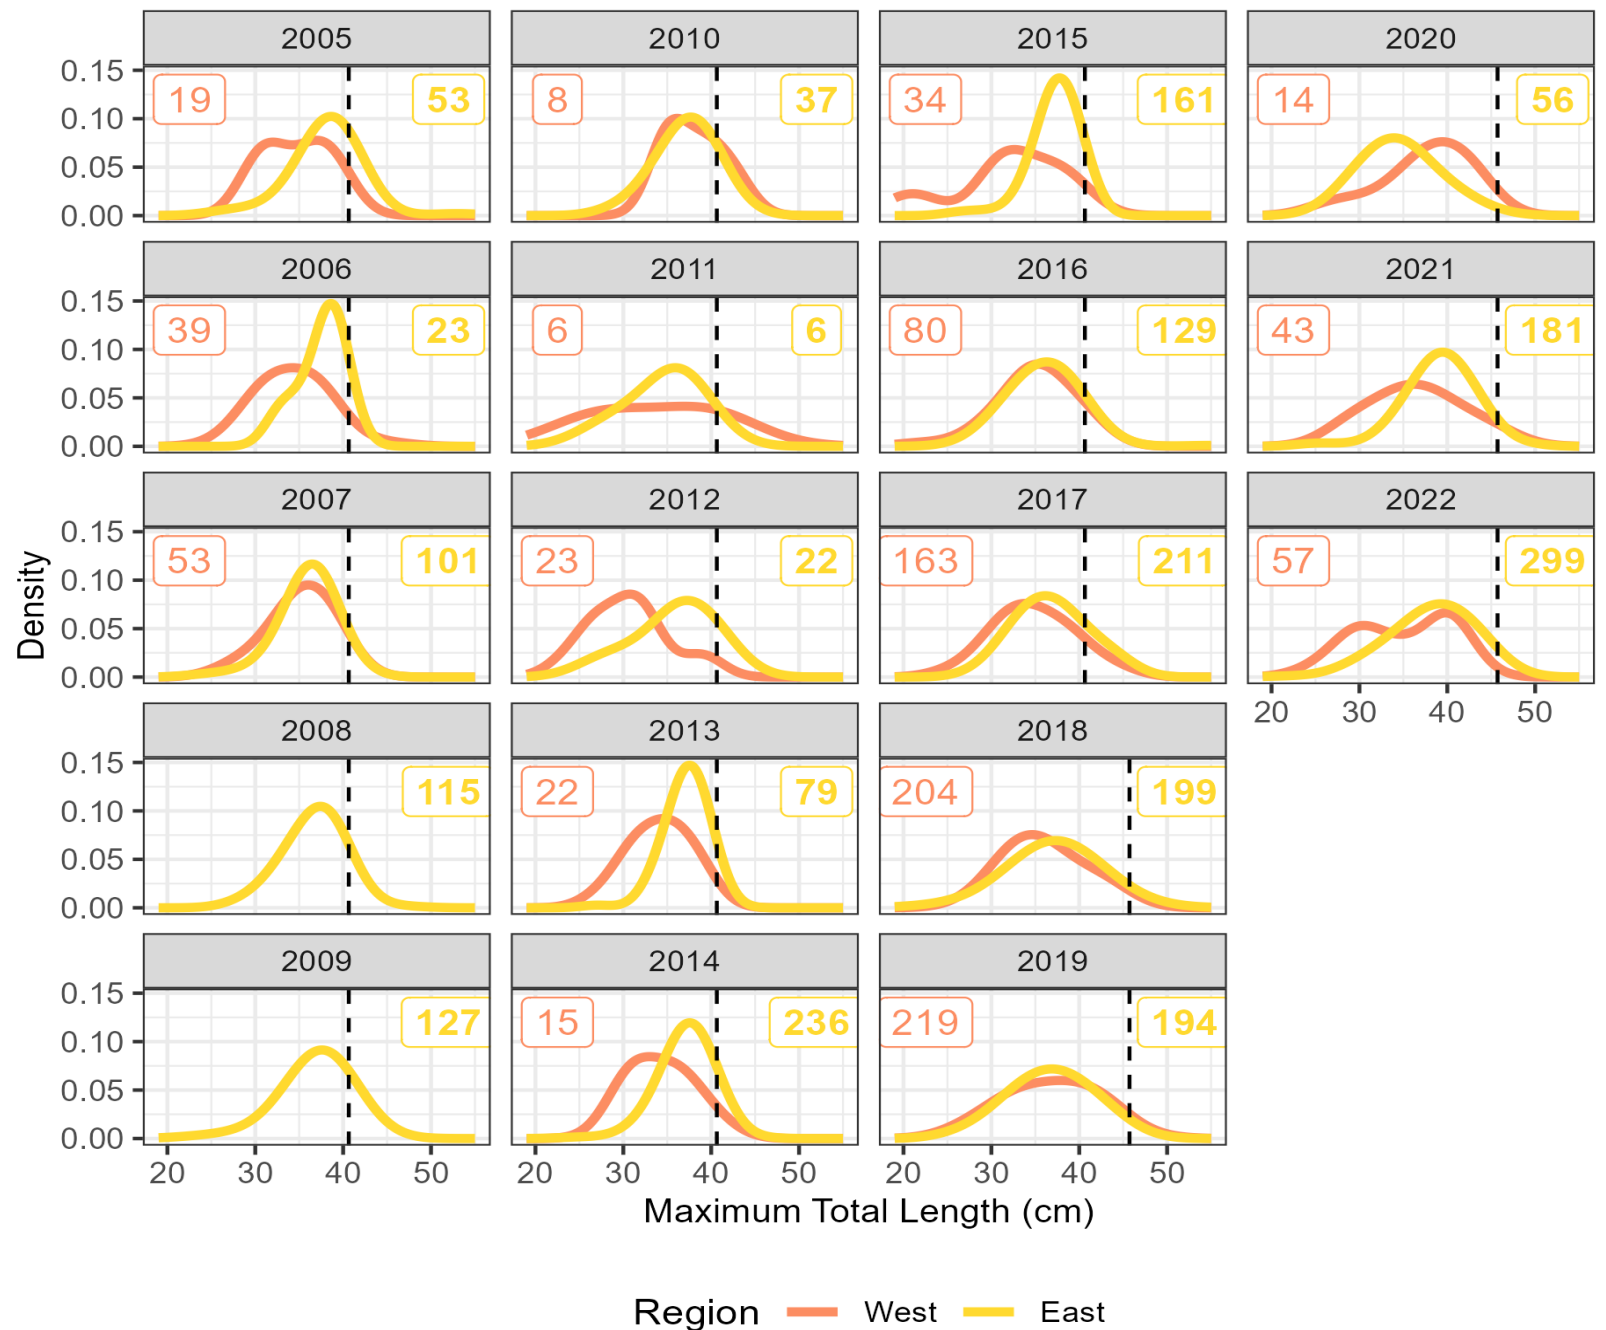

Recreational Releases By Region Caught

Recreational Releases By Mode

Recreational Release Lengths

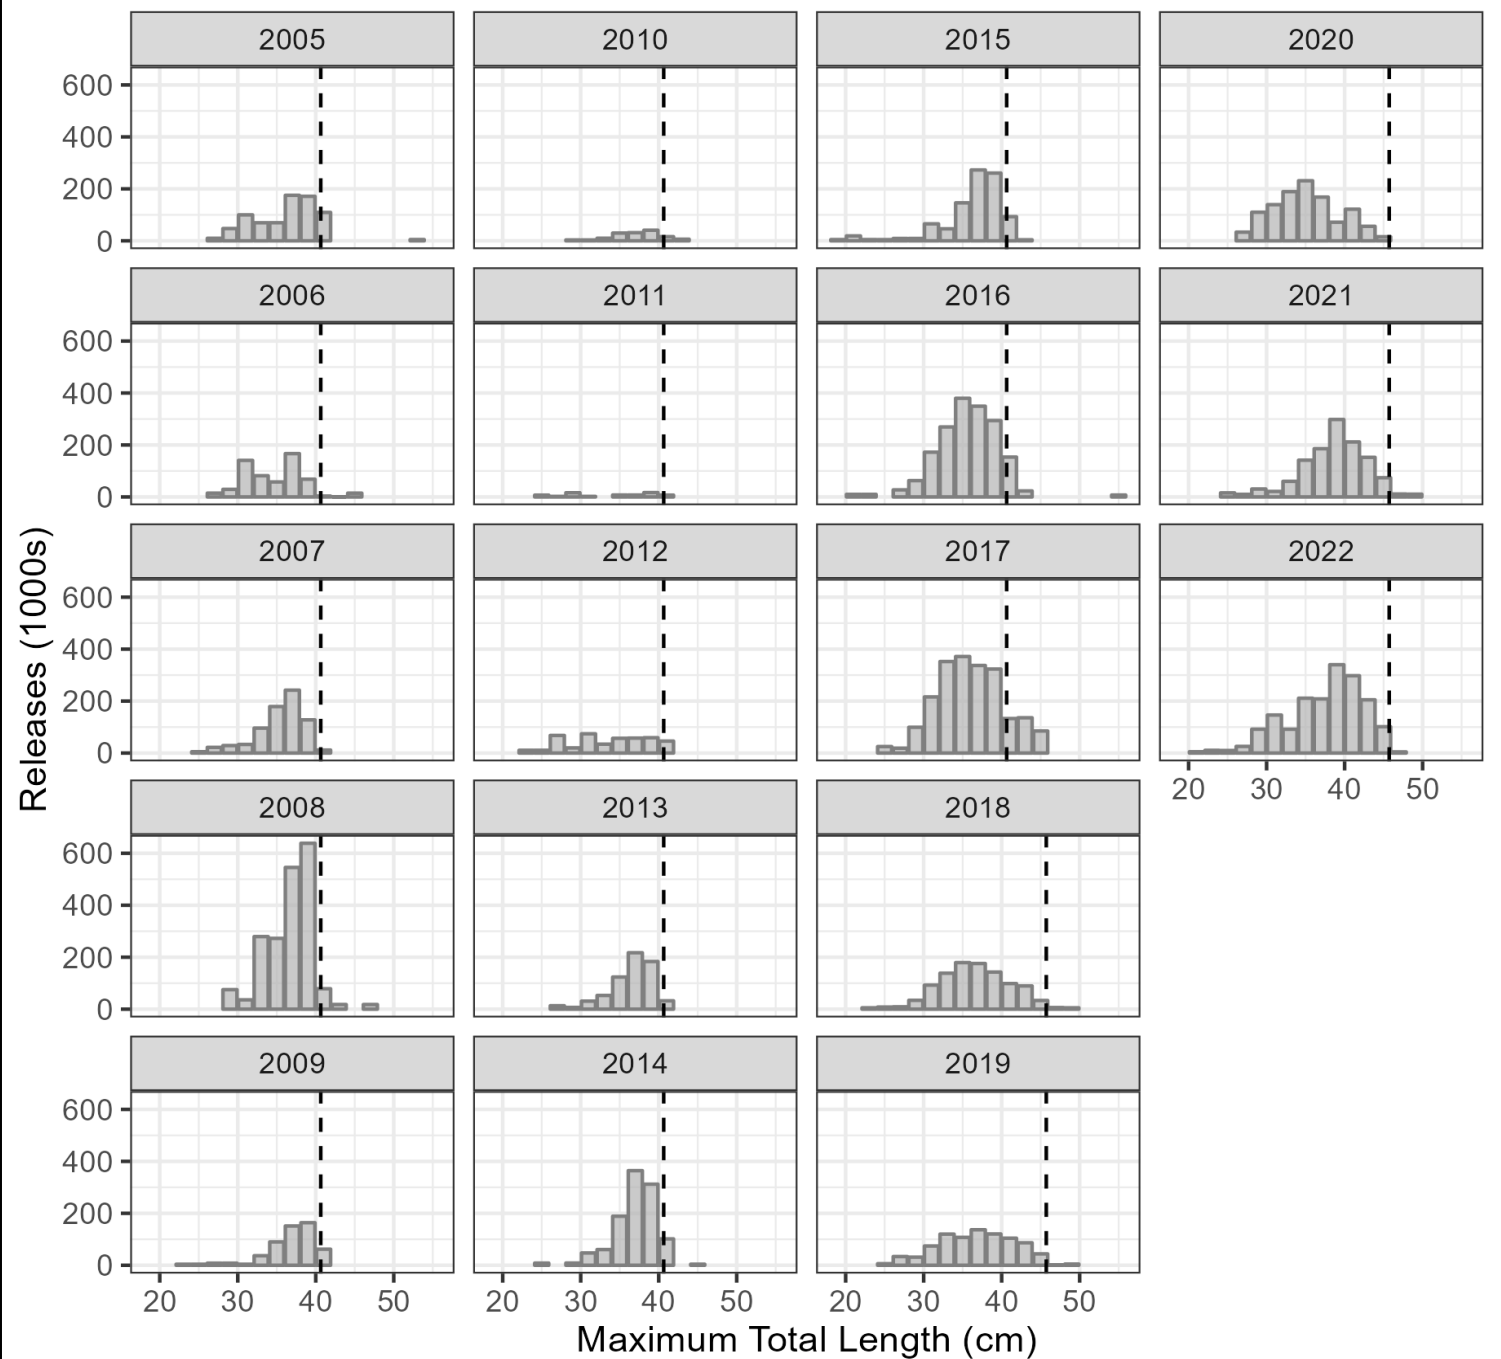

Explorations and Resulting Decisions

1. The FL Keys and SE FL account for most of the releases since 1981.
2. The private and shore modes account for nearly all releases but no release lengths.
3. Headboat and Charter release lengths are very similar. Larger fish may be released in the East region compared to the West, but sample sizes are insufficient.
4. **Decision: Combine sampled release lengths for headboat and charter modes and weight the length comps by the releases by year.**

Recreational Releases-at- Length

Upcoming Tasks

1. Consider weighting length comps for the Commercial Longline Index by using area-weighting (Maunder et al. 2020).
2. Consider methods to infer recreational release lengths prior to 2005.
3. Estimate Releases-at-length for the commercial 'Other' fleet.

SCRFA.org

Age-Length Keys and Catch-at-age

Catch-At-Age

- Multiply Catch-At-Length (CAL) matrices by Age-Length-Key (ALK) to estimate Catch-At-Length and Age (CALA)

$$\text{CAL} \times \text{ALK} = \text{CALA}$$

$$\begin{pmatrix} L_1 \\ L_2 \\ L_3 \\ L_4 \end{pmatrix} \times \begin{matrix} & \begin{matrix} A_0 & A_1 & A_2 & A_3 \end{matrix} \\ \begin{matrix} L_1 \\ L_2 \\ L_3 \\ L_4 \end{matrix} & \begin{pmatrix} P_{A0,L1} & P_{A1,L1} & P_{A2,L1} & P_{A3,L1} \\ P_{A0,L2} & P_{A1,L2} & P_{A2,L2} & P_{A3,L2} \\ P_{A0,L3} & P_{A1,L3} & P_{A2,L3} & P_{A3,L3} \\ P_{A0,L4} & P_{A1,L4} & P_{A2,L4} & P_{A3,L4} \end{pmatrix} \end{matrix} = \begin{matrix} & \begin{matrix} A_0 & A_1 & A_2 & A_3 \end{matrix} \\ \begin{matrix} L_1 \\ L_2 \\ L_3 \\ L_4 \end{matrix} & \begin{pmatrix} C_{A0,L1} & C_{A1,L1} & C_{A2,L1} & C_{A3,L1} \\ C_{A0,L2} & C_{A1,L2} & C_{A2,L2} & C_{A3,L2} \\ C_{A0,L3} & C_{A1,L3} & C_{A2,L3} & C_{A3,L3} \\ C_{A0,L4} & C_{A1,L4} & C_{A2,L4} & C_{A3,L4} \end{pmatrix} \end{matrix}$$

- $P_{A0,L1}$ = Proportion of the number of fish in length bin 1 that are age 0
- Rows of ALK sum to 1: $P_{A0,L1} + P_{A1,L1} + P_{A2,L1} + P_{A3,L1} = 1$
- Catch At Age (CAA) is estimated by summing over lengths (i.e. columns) of the CALA matrix

ALK Methodology (Work in Progress)

1. Ideally ALKs would year, region, fleet, and survey-specific and by sex if sexually dimorphic.
2. To increase sample sizes, ALKs must be aggregated across some strata. Resulting in ALKs by year and fleet, for example.
3. An age distribution for a length bin in a given year and fleet is estimated (i.e., smoothed) if the number of fish aged in that bin is less than 5 (Coggins et al. 2013).
4. Estimation is done by fitting a multinomial generalized linear model (GLM) with the vglm package in R.
5. Example Covariates: length bin, year, fleet (e.g. REC EAST/REC WEST/ COM OTHER/COM LL/FI), plus interaction terms with age

SCRFA.org

Modelling Platforms

Age Structured Assessment Program (ASAP version 3.0)

- Forward-projecting statistical catch-at-age model written in ADMB
- Age- and year-specific values (e.g. nat. mortality, avg. catch weight, avg. spawning weight, etc.)
- Compositions and selectivities are age-based. Landings and discards are in metric tons.
- Starts at calendar age = 1
- Requires more pre-processing of data (e.g., ALK and Catch-at-age).
- Estimates population numbers, fishing mortality rates, stock-recruit params, F and reference points pertaining to MSY or MSY proxies, F corresponding to yield per recruit ($F_{0.1}$, F_{max})
- Uncertainty for F , SSB, Jan-1 biomass, and MSY related reference points characterized via Monte Carlo Markov Chain (MCMC)
- Stochastic projections made via AgePro
- Model diagnostics available (e.g. retrospective analysis, model fit summaries, R compatible outfile)

Stock Synthesis (version 3.30.22?)

- Integrated statistical catch-at-age model (Methot and Wetzel 2013)
- Less processing of data inputs compared to ASAP (e.g., lengths and landings can be in numbers, internal catch-at-age calculation)
- Allows for additional options for model configuration (e.g., selectivity function types, blocks, seasons, recruitment timing, etc.)
- Compositions and selectivities can be length- or age-based
- Estimates population numbers, spawning biomass, fishing mortality rates, stock-recruit params, reference points pertaining to MSY or MSY-proxies (SPR), F pertaining to spawning-potential ratios ($F_{xx}\%SPR$), etc.
- Projections made via an additional user-specified estimation phase
- Model uncertainty characterized via bootstrapping, likelihood profiling, and MCMC
- Model diagnostics available (e.g., jitter analysis, retrospective analysis, model fit summaries, R4SS, sensitivity analyses)

Some Model Quirks:

- ASAP v.3
 - 1 season model (i.e., annual)
 - Spawning can be anytime during the year and recruits enter Jan 1 the following year at age 1.
 - Landings and releases in numbers must be converted to metric tons.
 - No internal bias correction for recruits
 - Mean Weights-at-age and release proportion at age are known without error

Some Model Quirks:

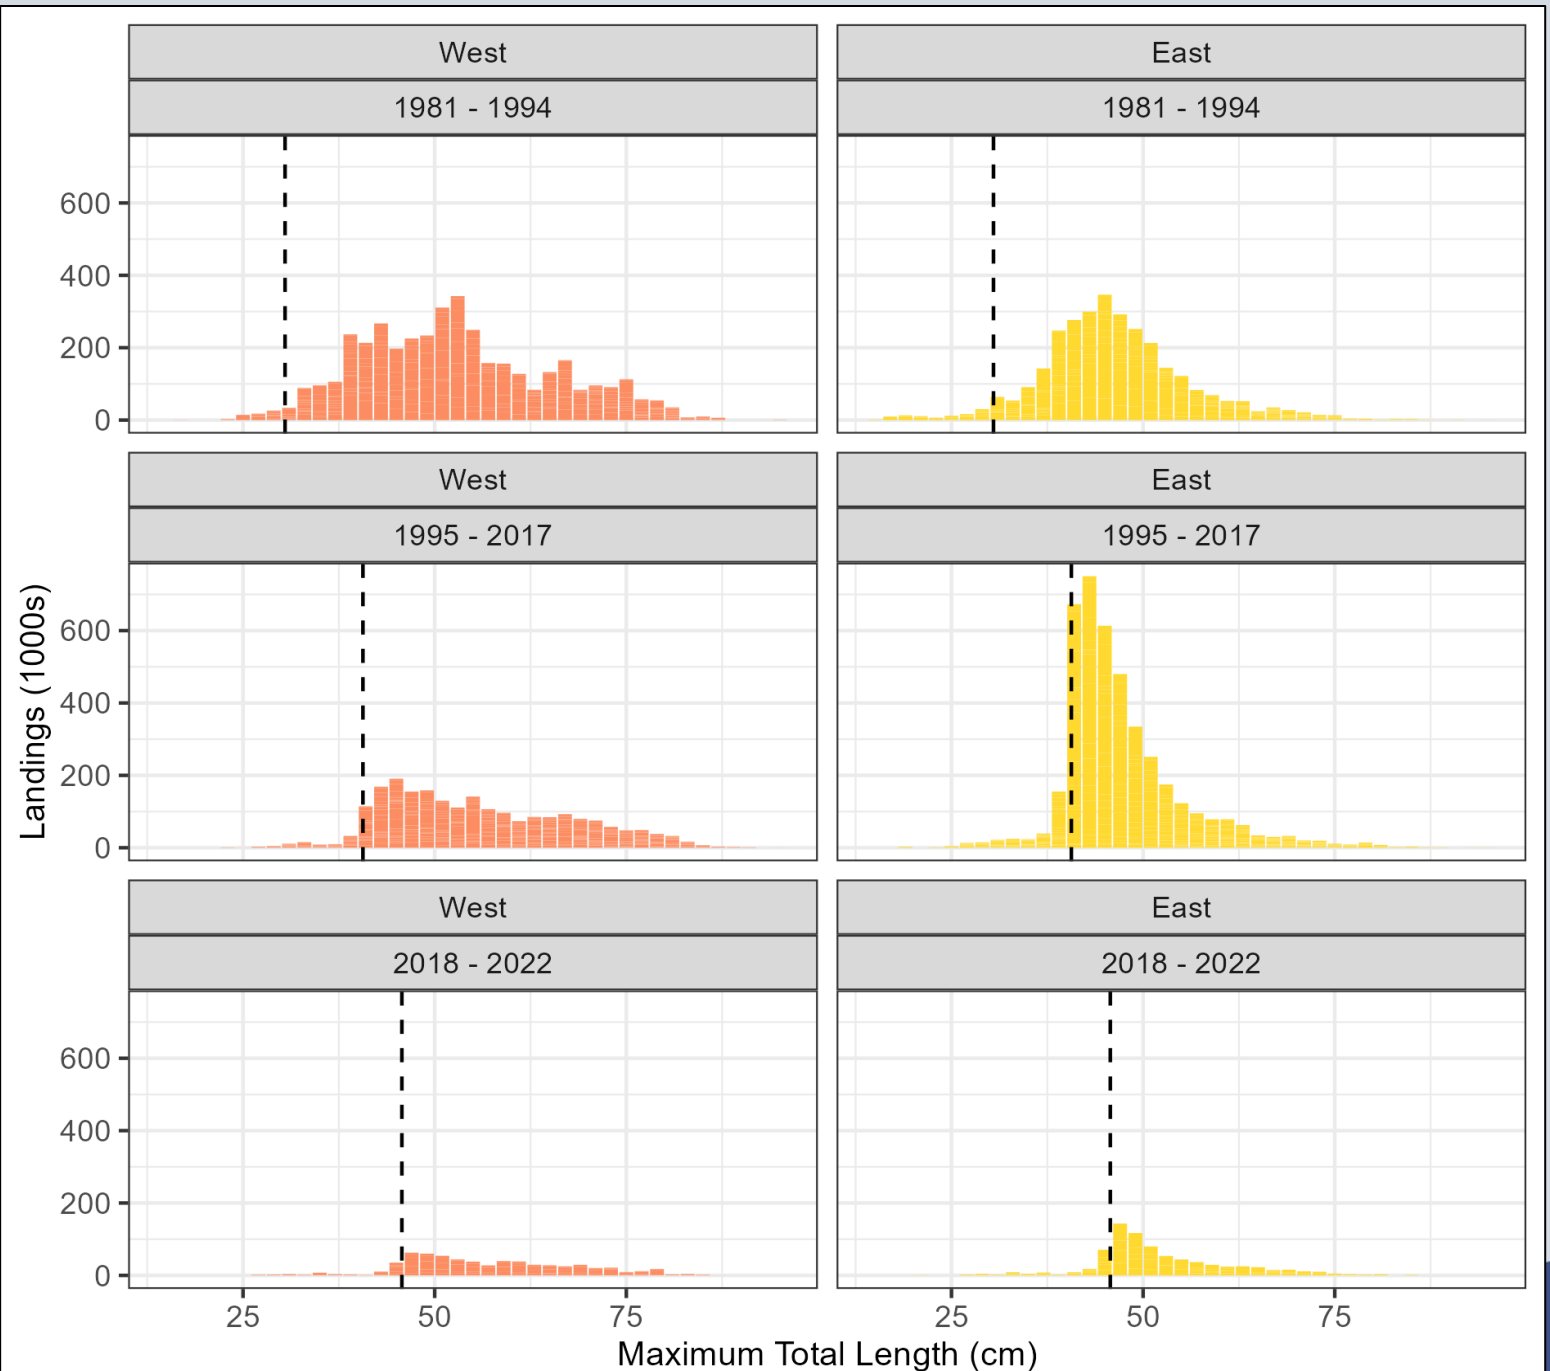

- Stock Synthesis (SS v.3.30.14)
 - Usually fits landings exactly at the expense of other data sources (e.g., indices).
 - 1 season model (i.e., annual)
 - Spawning occurs on Jan 1 → 'settlement' can occur at any time during the year.
 - Spawning after Jan 1 → 'settlement' must occur in the following year.
 - 2 season model (e.g., season 1 = Jan – Aug; season 2 = Sept – Dec)
 - spawning can occur anytime in season 1 and settlement can occur anytime in season 2 (e.g., spawning on June 1 with settlement in Sept)
 - Landings, length/age comps, etc. must be split by season

A large school of fish, likely snappers or groupers, is swimming in clear blue water above a diverse coral reef. The fish are mostly silver with some yellowish-brown tones. The reef below is covered in various types of coral and green algae. The overall scene is peaceful and vibrant.

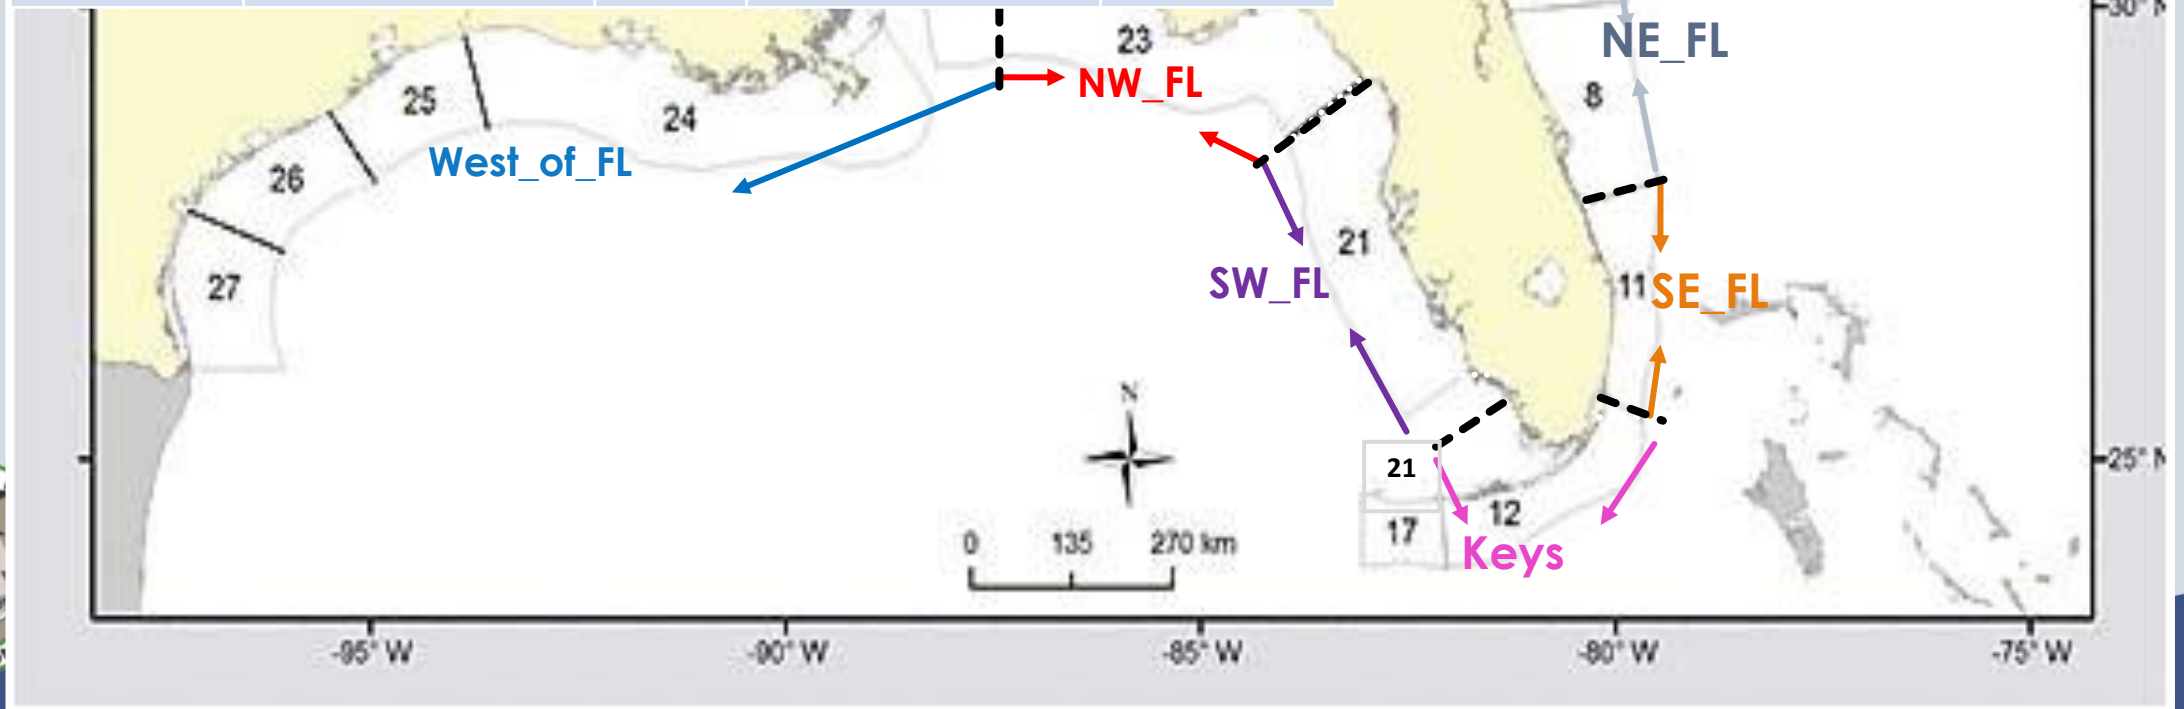

Thank you for your attention!
