NOAA FISHERIES

Mid-water Snapper Complex

Silk snapper

Wenchman

Blackfin snapper

Queen snapper

Wenchman

- Found over rough bottom (McEachran, and Fechhelm 2005)
- Depth range 24 - 370 m, usually 50 - 250 m (Fishbase), 24 – 488 m (McEachran, and Fechhelm 2005)
- Max length
 - 56.0 cm TL male/unsexed but commonly 20 cm TL (Fishbase)
 - 47.1 cm FL (NMFS Groundfish Survey)*
 - 56.0 cm FL (Commercial longline)*

Figure 2. Length frequency histograms for Wenchman captured during MSLABS Small Pelagics surveys from 2002-2014.

From SEDAR 49

*SEDAR 49

Wenchman

- Because few fishermen land wenchman, confidentiality issues make presenting landings information difficult.
- Recreational landings are negligible, and less than 0.2% of the total removals on average (2012-2020).
- Commercial landings mostly come from trawls (range 93-99% of the total between 2014 and 2020).

Mid-water Snapper

The 2011 Generic Annual Catch Limit and Accountability Amendment set the

- Overfishing limit (OFL)
- Acceptable Biological Catch (ABC)
- Stock Annual Catch Limit (ACL)
- Stock Annual catch target (ACT)

OFL and ABC based on 1999-2008 landings data (Tier 3a)

OFL	ABC	ACL	ACT
0.209 mp ww	0.166 mp ww	0.166 mp ww	0.136 mp ww

From Table 2.7.5.1.1. OFL and ABC specifications from SSC and ACL/ACT specifications from the Gulf Council.

- In order to consider a species-specific OFL and ABC for wenchman, the SSC must address several outstanding questions.

<https://txmarspecies.tamug.edu>

Question 1: Separate Wenchman from Mid-Water Snapper?

- Recently, wenchman catches are increasing, and increasing relative to other members of the complex.
- Complex should include members with similar life history and vulnerability to fishery.
- Angler testimony that wenchman are often caught in association with butterfish and scad.

Wenchman Landings (Rec + Com)
1999-2021

Fraction of Total Annual Mid-Water Snapper Catch, by Species

*2021 Landings Preliminary and only through November

Question 2: Continue to use Tier 3A?

- Tier 3 - No assessment is available, but landings data exist.
 - Tier 3A: Based on expert evaluation of the best scientific information available, **recent historical landings are without trend, landings are small relative to stock biomass, or the stock is unlikely to undergo overfishing if future landings are equal to or moderately higher than the mean of recent landings.**
 - Tier 3B: Based on expert evaluation of the best scientific information available, **recent landings may be unsustainable.**
- For stock complexes, the determination of whether a stock complex is in Tier 3a or 3b will be made using all the information available, including stock specific catch trends.

Department
<https://txmarspecies.tamug.edu>

- Last assessed: SEDAR 49 – Data Limited Species, assessment was not used to develop management advice.
- Representative Index: SEFSC Small Pelagics Acoustic Survey
 - Full GOM coverage at depths where wenchman occur
 - High positive occurrence (~60%)
 - Time series: 2002 – 2013
 - Gear: High-opening bottom trawl
- Survey ended in 2016
 - 2014 and 2016 not included due to limited spatial coverage due to vessel breakdowns
 - No survey in 2015

NOAA
FISHERIES

SEFSC Small Pelagic Acoustic Survey

SEFSC Small Pelagic Acoustic Survey

NOAA
FISHERIES

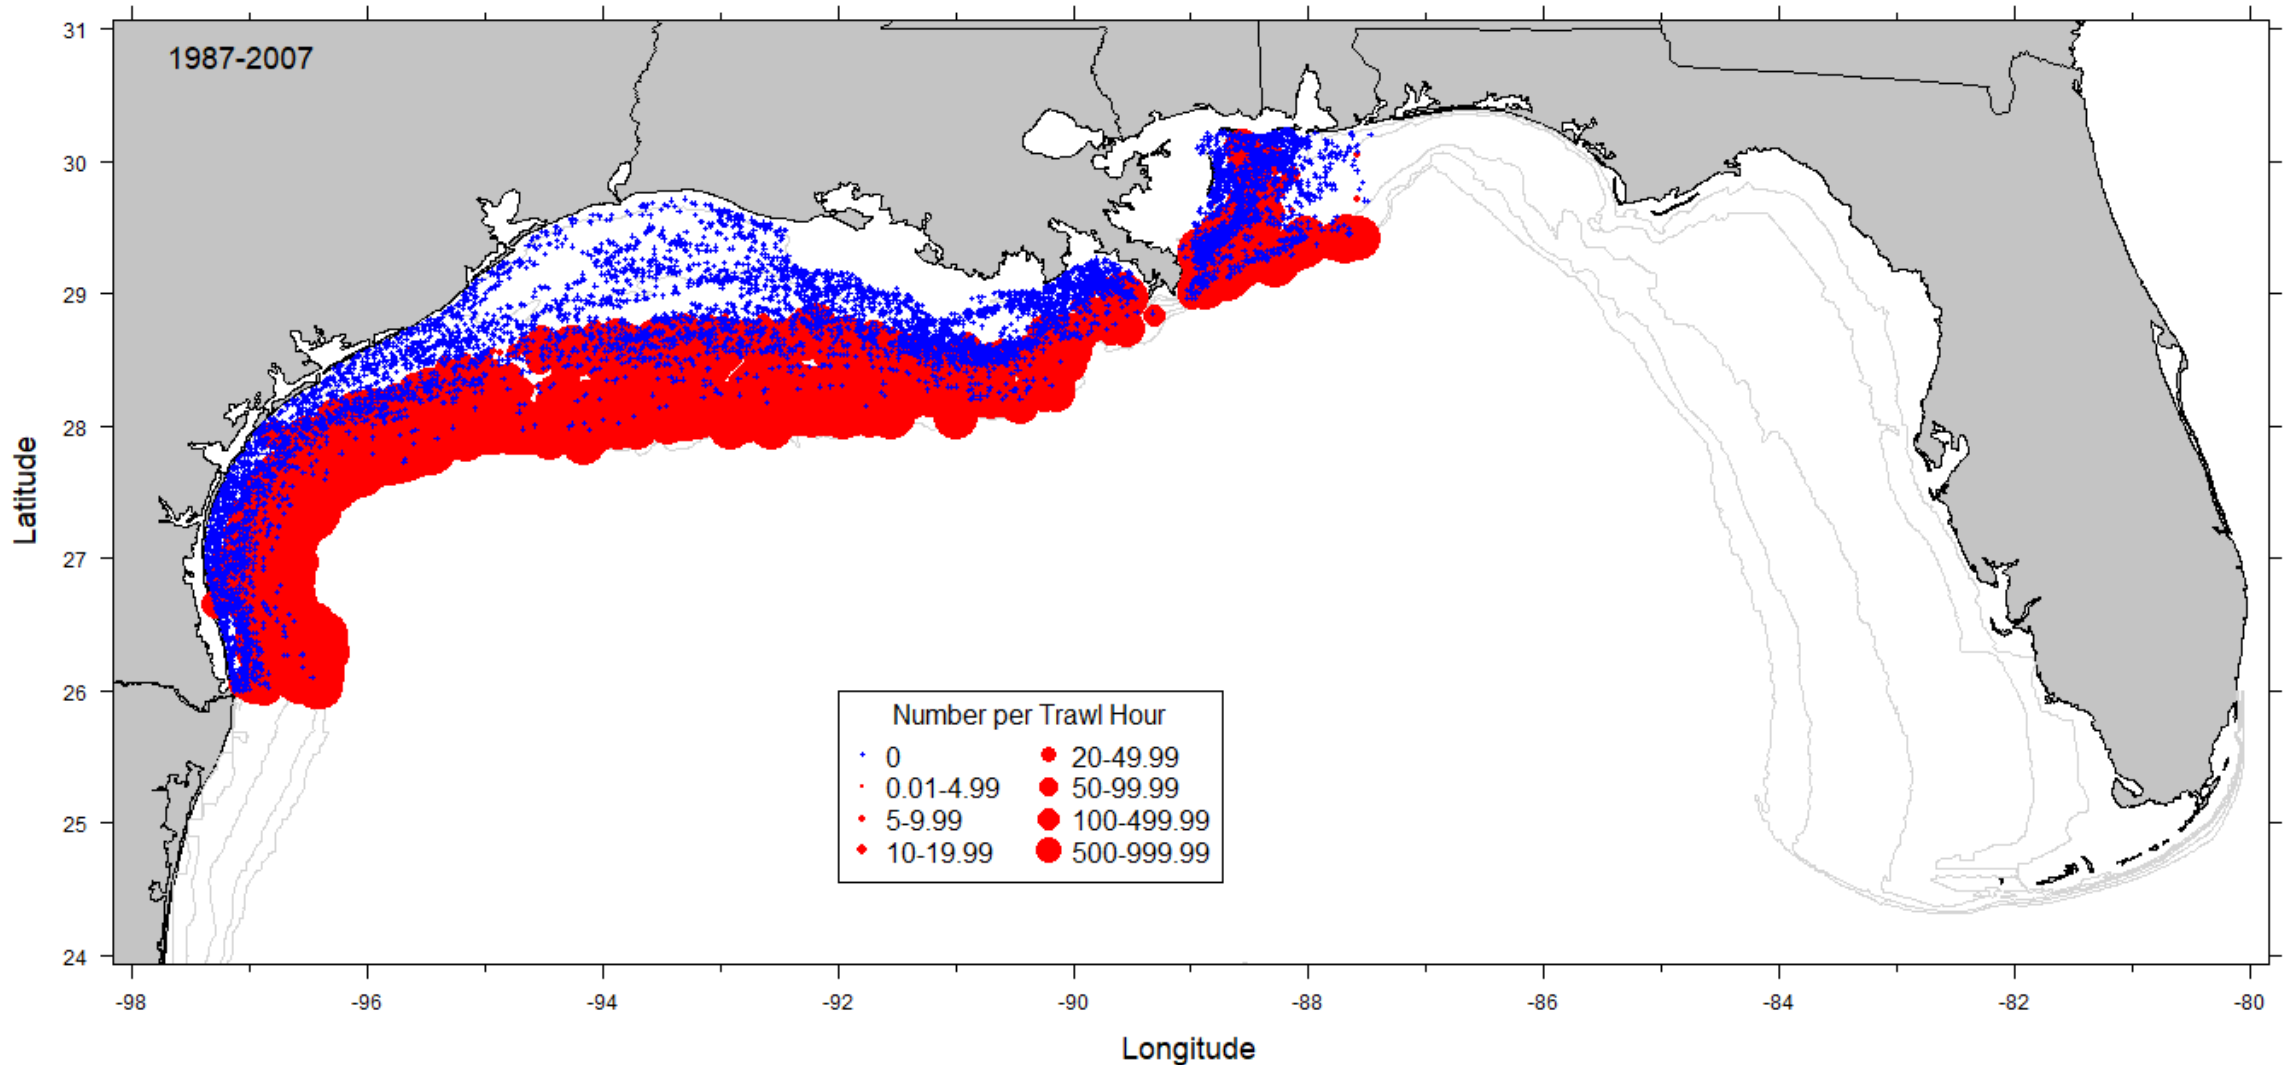

SEAMAP Groundfish Survey

- Primarily a western gulf index
 - Combined Summer and Fall survey data
- Split time series due to design change in 2008
 - Expanded sampling universe
 - Standardized 30 minute tow
- Allowed incorporation of data to Cape San Blas, FL
 - Previously index only used data to Mobile Bay, AL
- Low to no catch east of Cape San Blas, FL
 - Based on Pelagic Survey, wenchman appear to be deeper in eastern gulf (past the 110 m outer limit of groundfish survey)

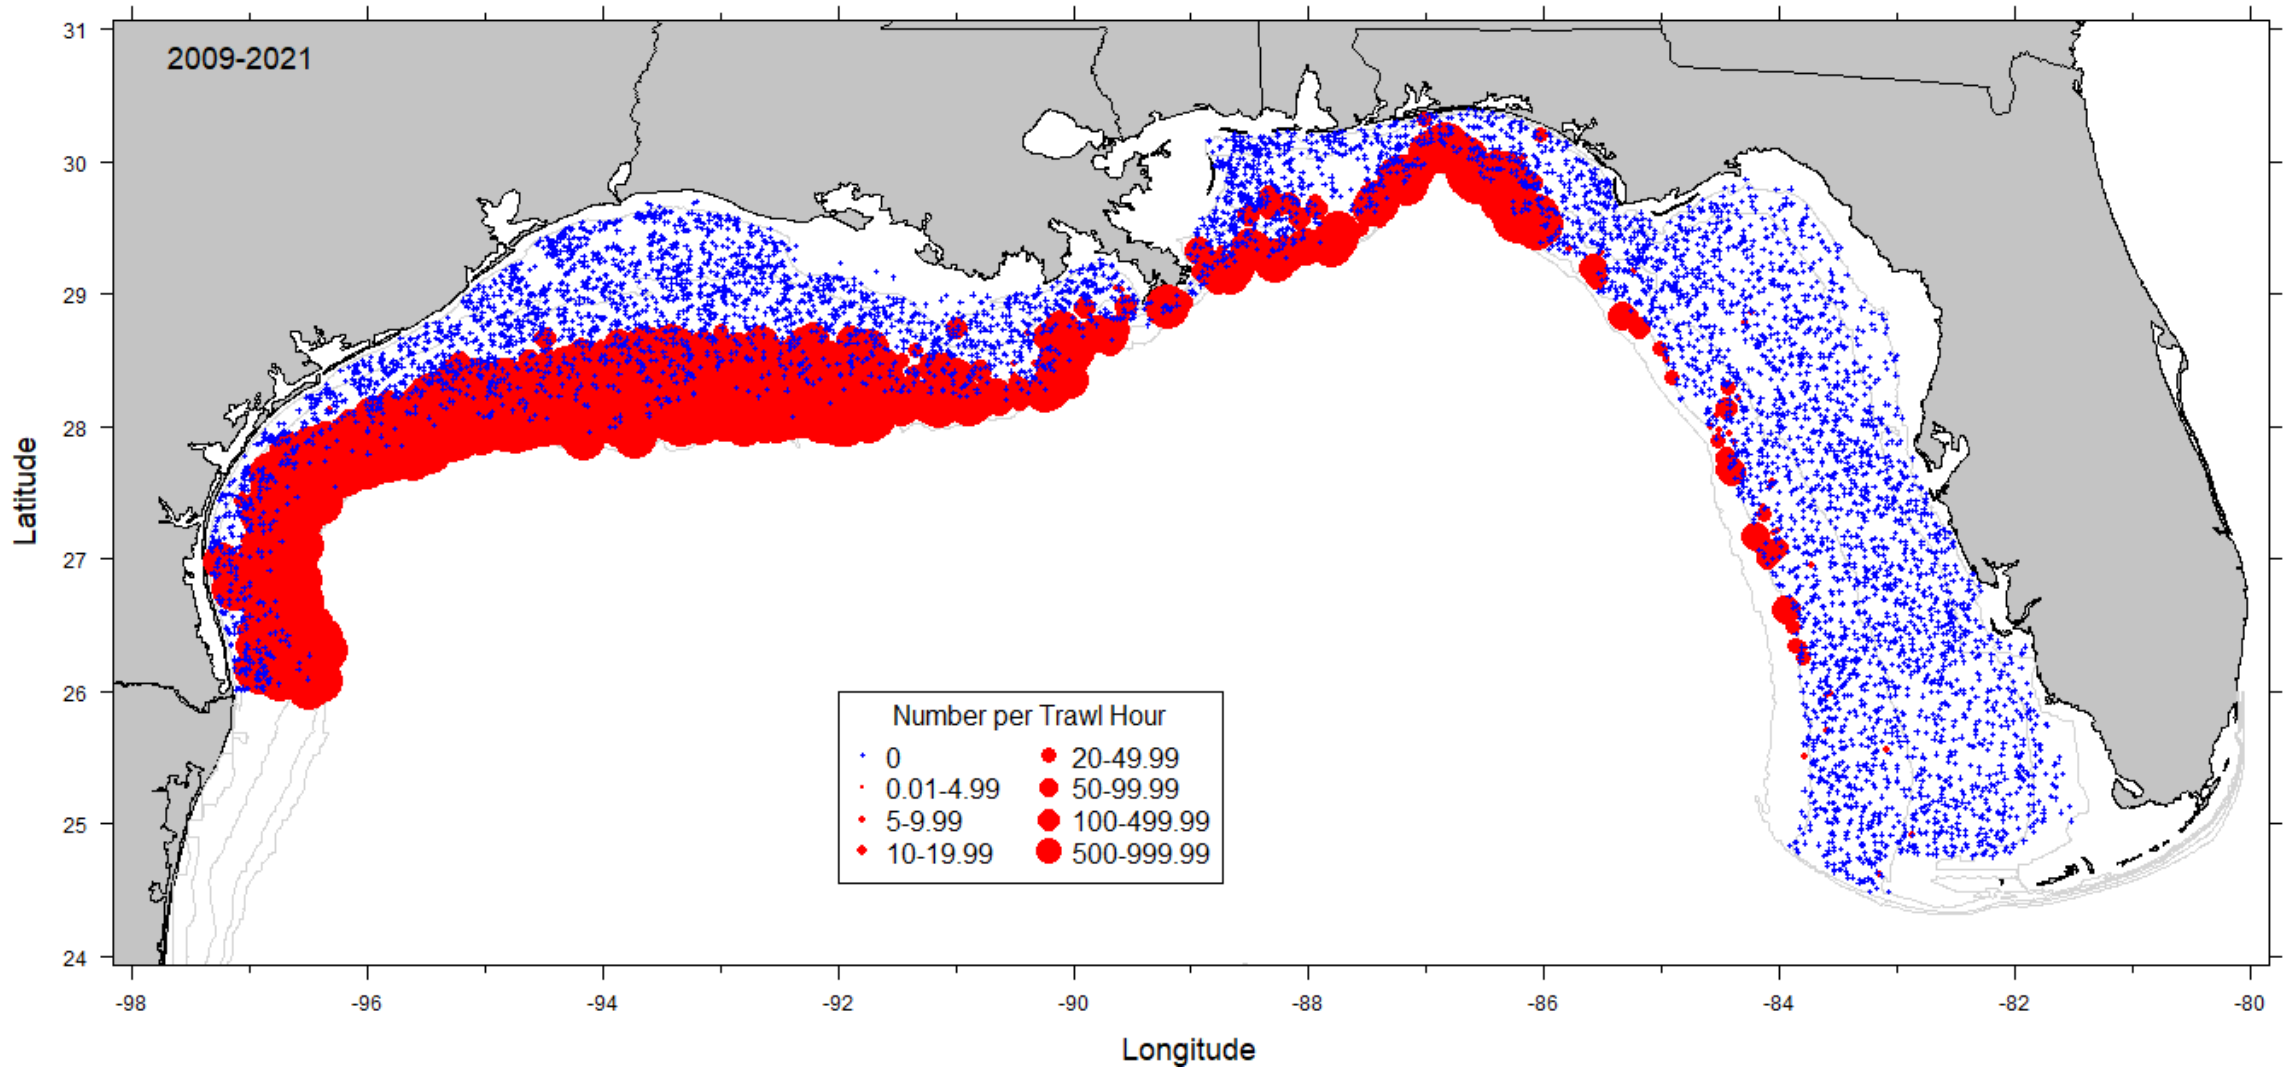

NOAA
FISHERIES

SEAMAP Groundfish Survey (old design)

SEAMAP Groundfish Survey (new design)

SEAMAP Groundfish (Summer and Fall)

* Each index is standardized to a mean of 1 within it's own time series

NOAA
FISHERIES

SEAMAP Reef Fish Video Survey

- Primarily a western gulf index
- Updated through 2019 – last year of available data
- Samples high relief offshore natural reefs
- Similar to SEAMAP Groundfish Survey, low to no catch east of Cape San Blas, FL
- Low positive catch (~5%)
- See SEDAR 49 working paper for abundance plots
 - Campbell, M.D., K.R. Rademacher, P. Felts, B. Noble, J. Salisbury, J. Moser, R. Caillouet . 2016. SEAMAP Reef Fish Video Survey: Relative Indices of Abundance of Wenchman. SEDAR49-DW-20. SEDAR, North Charleston, SC. 21 pp. [Link](#)

Question 3: Reconsider reference years?

Source: 2011 Generic ACL Amendment

Figure 2.2.1d. Annual commercial and recreational landings of silk snapper, queen snapper, and wenchman in the Gulf of Mexico. (Average based on years 2000-2009.) Blue shaded area not used in calculation of average annual landings. (Source: Southeast Fisheries Science Center ACL datasets, 2010)

Wenchman Landings (Rec + Com)
1999-2021

Question 4: Use default OFL and ABC? **THIS SLIDE FOR TIER 3A**

- OFL: Set the overfishing limit ***equal to the mean of recent landings plus two standard deviations***. A time series of at least ten years is recommended to compute the mean of recent landings, but a different number of years may be used to attain a representative level of variance in the landings.
- ABC: Set acceptable biological catch using a buffer from the overfishing limit that represents an acceptable level of risk due to scientific uncertainty. The buffer will be predetermined for each stock or stock complex by the Council with advice from the SSC as:

ABC = mean of the landings plus 1.5 * standard deviation	(risk of exceeding OFL = 31%)
ABC = mean of the landings plus 1.0 * standard deviation (default)	(risk of exceeding OFL = 16%)
ABC = mean of the landings plus 0.5 * standard deviation	(risk of exceeding OFL = 7%)
ABC = mean of the landings	(risk of exceeding OFL = 2.3%)

Question 4: Use default OFL and ABC? THIS SLIDE FOR TIER 3B

- OFL: Set the overfishing limit *equal to the mean of landings*. A time series of at least ten years is recommended to compute the mean of recent landings, but a different number of years may be used to attain a representative level of variance in the landings.
- ABC: Set acceptable biological catch using a buffer from the overfishing limit that represents an acceptable level of risk due to scientific uncertainty. The buffer will be predetermined for each stock or stock complex by the Council with advice from its SSC as:
 - ABC = 100% of OFL
 - ABC = 85% of OFL
 - ABC = 75% of OFL (default)
 - ABC = 65% of OFL

Conclusions

- OFL and ABC for wenchman can be calculated rapidly if the SSC determines:
 - That it is appropriate to separate wenchman from the mid-water snapper complex
 - Which tier of ABC Control Rule to use
 - The reference years
 - The reduction from OFL to use to compute ABC

Questions
